Greetings.... I am wondering if there is anyone out there that is familiar (intimately??) with a Clipperton-L and problems with parasitics etc etc etc... I have tried to read some of the threads on the users groups that have to do with this problem and ones like it but they keep going off on so many tangents that it's hard to keep track of what is trying to be said. Everyone has their own opinions as to what causes parasitics and how to remedy them... My problem is that back several years ago my bandswitch zorched due to what I think was a parasitic. I rebuilt it, installed it after replacing all four suppressors on the tubes (two were cracked...another indicator). During the time it took me to remove the switch and then repair/replace it (two years) I lost the notes I had taken that showed where all the connecting wires went to on the switch from the various tap points on the tank coils . I was able to figure out where they went using the schematics (actually about 95% sure). Now I only get output on 160 mtrs. One thing that I think is telling me that I am still dealing with parasitics is that as I sweep the tuning and loading controls through their range without drive, I see the plate current meter peak. Also I'm not sure if I'm also dealing with bad output tubes. If I seem to be getting good power out on 160, wouldn't that tell me that my tubes are good??? or do they lose something even going up to the next band (75mtrs), Should I just junk this amp and spend my time and money on another amp. I guess I just feel like I'm spinning my wheels at this point. Can this amp be made to work reliably and well without spending hundreds of dollars. Heck for that kind of money I'm almost halfway to a used AL 80 or L4-b. At least they seem to have a decent track record... Or, I have 99% of the parts to build a 4-1000 rig... A project I've put off for years but maybe with winter coming, it's not starting to look that bad..... and I can heat my house with it!!!!
Any Help would be appreciated.....
73 Tim KB1MM

1797. Who sells Fair-Rite Parts in Small Quantities?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-10 00:00:00 UTC
From: luke@trio.COM.AU

Source record: 68030

dave,
thanks for the tip....I'll give that a shot and see what's what....I understand the part about isolation...that'll be handled by mounting the controller inside a separate sheilded enclosure and using a db9 w/feed through capacitors (these have the caps built in..I know that's over kill..but I want this puppy to last and work turn key...)
AVR? interesting...I'll check the Newark or Allied catalogs to see what those creatures cost...(you know ham operators...trying to make sow's ear's into all mode multiband rigs for pennies...)
As far as the "Dark side...yep...it'll be a hoot"...don't forget the Jack Daniels...
dave

From: Tibor Bece <tbece@netspace.net.au>
Message-ID: <37B0C51A.6B3B@netspace.net.au>
Source record: 68031

Hi all,

I have a few very nice professional PCB's left over for the AD9850/51. It is only for the DDS IC, I do not believe in LO's too near to the CPU :) The design has a proper ground-plane, 5V regulator +EMI filters on board, silk-screen and plated through holes, line conditioning for the serial signals, 9th order output LPF. All components are SMD, 0805, except for the 5V regulator and the XO. The XO can be DIP8 or DIP14. PCB Size ~1.1in x 1.4in. Email me for details if anyone is interested.

SFDR from the AD9850 is excellent, from a 125MHz XO one does not see much above -70dBc (as usual, 'bad frequencies' are low N/M ratios to the xtal). The AD9851 internal 'x6' is very useful, for instance running the DDS from a lower frequency TCXO module. The spectral purity in this mode is excellent, perhaps a touch worse than in the 'clean' 175MHz XO mode, but probably much better than people generally realise.

Thanks Analog Devices!

I'm sure the manufacturer would be able to help you. Unitrode has an
excellent tutorial that holds your hand through the design process and has
torroid part nos, etc.
It seems that every analog chip maker has new chips for controlling them.
They can be talked out of samples and have schematics to get you started.

1804. Vernier dials for receivers etc.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-11 00:00:00 UTC
From: sabbatai_zvi@hotmail.com
Message-ID: <37b0ec61.7594638@news.earthlink.net>
Source record: 67953

Is anyone building receivers these days? I know several guys who like to build old regen style radios, and others who repair older tube-type receivers. The last regen I built was a tube receiver with an FET front end that worked quite well.

Does anyone have any use for some Bourns locking knobs for pots? Or Vernier reduction drives (Jackson Brothers) 5.6:1

I doubt if anyone other than homebrewers has any use for these items.

Some fellows have told me that the Jackson Brothers reduction drive is used on Swan rigs among others. Can anyone confirm this?

1805. Still more nearly free stuff in Oradell, NJ

Newsgroup: rec.radio.amateur.homebrew

Still have stuff to almost give away. Here in Oradell NJ, exit 165
off the Garden State Parkway. Then head 2 miles east. Call me
at 201-261-4066 so I can be around to expect you, and give you the
exact address.

HP VTVM model 400D
General radio frequency meter and discriminiter 1142A
Eico audio signal genmerator model 377
Eico VTVM model 232
Ballantine labs "sensitive inverter"
Link radio corp frequency meter model 2051b
2 boxes of microvave waveguides
PRD klystron power supply model 809a
Bell and Howell schools vom

And some more stuff, including speakers and horns.

Perfer pickup but if you're willing to spring for "Mailboxes Etc"
rates, will ship, buyer pays it.

All stuff as is, probably works but I don't have time to test,
figure on restoring it. Everything is complete and in good shape,
no rust.

In article <7oq9mpjh1@plutonium.btinternet.com>, D.L.C@btinternet.com says...
>
sawtooth oscillator = current source + cap + comparator + discharge transistor.

The current source charges the cap giving a ramp, when the ramp meets the
comparator's threshold the discharge transistor turns on discharging the cap
and the cycle begins again. Adjusting the current source alters the frequency
and the comparator threshold determines the amplitude.

Malcolm

I don't recall ever seeing a ramp generator using a zener, though I recall some articles that had some quite oddball diodes doing the job (and I can't remember what they were, and don't think I ever saw them elsewhere). If zeners worked, I think we'd see them commonly used, since they are common.

A unijunction transistor is the simplest way to go. A 555 (I know you asked for no IC, but you didn't say why) with pins 2 and 6 and 7 tied together and the cap from there to ground and a resistor from there to the supply voltage, will do the same thing, and is sometimes easier to come by.

YOu use to see a PNP and NPN combo that in effect synthesized a unijunctio, but I sure can't remember the exact details. Anyone could pull bipolar transistors out of their junkbox, but I don't recall ever seeing a unijunction that I didn't specifically buy.

If you need a linear ramp, either the unijunction or the 555 can provide one, so long as you use a current source instead of the resistor.

One of the problems with these are that they don't start at zero volts; certainly not the 555. If you want a sawtooth for sound, it doesn't much matter since you can AC couple it. But if you want it for a DC ramp to voltage control something else (such as sweeping a voltage controlled oscillator), you may want something fancier.

Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday ...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 15th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Humm, SCRs and TRIACS are breakover devices. Snap and they are all the way on. How do you generate a sawtooth wid that? Unijunction is a cheap way to go, but for dc rail to rail; use an op amp.

I've gotten a lot of responses with a lot of suggestions, and I appreciate all your input into the matter. One thing in common, all want the radio for parts, so here's my angle: I need the MARS / CAP mod for the Yaesu FT2600 mobile. I've talked to Yaesu tech support who said they would give info to a valid MARS / CAP certificate holder, which i'm not. I know this radio's not type accepted...blah blah blah...but this is a fine radio, and I would like to put all my ham / public service stuff into one field programmable radio. Whoever can get the mod for me first will get the radio and mic, I'll even pay shipping. Please help!!! This info is available for free out there, just takes resources that i don't have....
Thanks a ton everyone!

Actually you can install a 2N2222 backwards and have it act like a lower gain transistor. If it is in an application where the power level is very low it may never even get noticed. On the job, I found production had been able to put them in backwards on a product one day and it was not discovered until the units were tested under heavy load.

Brian,
The Command/Logic Board is kaput. If you are brave enough,open the puppy up and look inside on the interface connection board....there may only (if you're lucky...) be minor circuit trace damage, if not then send it to Motorola. They charge a flat rate of 225 (at least that was the latest price I had from 3 months ago...) and they'll repair it.

(NOTE: Anti-spam at work. Read the last line of this note)

I have an odd one here. Hope someone can help.

A customer is installing one of our meteorological systems at a small airport. The signal cable between the sensors and the display panel will be close to the antenna coax (i.e. about 12 inches apart where they both enter the building through the wall). He is concerned about the possibility of the radio signal imposing EFI onto my signal cable. Also, he is sizing the signal cable to be about 50 feet too long in case he needs to move the weather display in the future. He plans to simply coil the signal cable and 'shove it under a desk'. He is concerned that the coil formed by looping the signal cable will act as an inductor and possibly as an antenna.

The signal cable is a 7 conductor (2 for power, 5 for signals) 22 gage with an overall shield. The power in the signal cable is about 15 VDC and the returning signals are all slow moving DC.

Personally I don't think he has anything to worry about in either case (unless he has crappy coax). However, I would welcome any comments.

Thanks.

There are a lot of variables here that will affect whether there is an RFI problem or not. Type of coax, amount of transmit power, frequency used, type of sensor cable, level of sensor signals, cable separation and how long the parallel run is. All you can do is try it and move the cables farther apart if you experience RFI.

1829. FS: $750.00Henry Radio 3000 watt generator/pwr amp and supply

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-12 00:00:00 UTC
From: Norman Gillaspie <norman@pcseng.com>
Message-ID: <37b374fb@jolt.pagesat.net>
Source record: 67978
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.swap

I have a Henry Radio generator that
has a 3CX3000 tube and amplifier stage.

The unit has a 14MHZ crystal oscillator followed
by a push-pull solid state pre-driver.

Both Solid the pre-driver and driver run off 28 volts.

The pre-driver uses a pair of MRF433 transistors and is
right out of the Motorola App notes.

A 300 Watt push-pull solid state driver amplifier is right out
of the Motorola APP note number EB27A it has 12db of gain
and will output 300 watts using MRF-422 transistors.

These amplifiers drive the 3CX3000 output stage.

I believe this unit can be modfied for a straight amplifier.

It looks in good shape.

It includes the power supply.

The final test report in indicated the following.

plate current .998 amps
grid current .300 amp
PA Voltage 4200 volts
PA Filament 7.6 Volts
3-23-95

The amplifier is in a 45 inch tall by 19 inch rack.

The unit has three sections which can be removed as a unit

3CX3000 tube amplifier section in a chassis with matching circuits
turns counter etc.

The solid State driver section with 28VDC supply

High voltage power supply. I have pictures I can send via email as
PDF files just ask.

I believe it works. I am trying to get schematics

However I am selling it as is. These units were used as RF Sputtering
sources.

I am asking $750.00 for this unit.

From time to time I get various pieces of RF equipment forsale to hams. If you would be interested in being notified when I have equipment forsale please
send an email to norman@pcseng.com and say add me to the list.

I am horrible at ASCII art so I will try to explain in verbage....

Charge a capacitor with a current less than the turn off current of an
SCR/TRIAC.
Connect the TRIAC across the cap.
Add a Zener from the cap to the TRIAC gate.
When the voltage gets high enough the TRIAC (or SCR) turns on pulling
the saw touth down.
When it gets to zero the SCR turns off and it does it again.

I have not tried this... but it should work.
It's been a long time since I've played at this level of discrete
analog....
but this should work. All in all I think IC's would be a lot easier.

>get it.good luck W4PQW
>.

The 4-1000 in grounded grid (with screen also grounded) couldn't even
get up to the old legal limit with 100 watts drive, let alone the
1500 watt limit. To have any hope of doing that, you would need to
run the screen with DC bias but at RF ground AND you would have to be
running 5000 volts on the plate AND you would have to have a high
impedance output tank that supports 5000 volts (no easy thing on
10 meters).

OTOH, driving the grid of the 4-1000 will probably result in lousy
linearity; it was never designed to be a linear amplifier.

Bottom line: I was once considering a 4-1000 linear (a long time ago)
and concluded this is simply the wrong tube period, even if you can
get them cheap.

(Of course my current linear uses MOSFET's but that's another story).

>protocols... is there a transmitter in the thing or just a receiver?

Standard pagers are receivers only - the transmitters transmit "blind"
and get no acknowledgement of whether the page was actually received.

So this pager will not transmit RF that's detectable from a long
distance. It will have a local oscillator, and knowing the model of
the pager you could find the frequency. But range will be short.
More seriously, *every other* pager of that model, plus any other
pagers of other models tuned to the same service and using the same
local oscillator, will also radiate the same frequency. Finding the
one pager you are looking for would be near impossible.

Some time ago, there were a couple of threads discussing efforts to extend the N6GN 2-mbit/s digital radio link project for use with more modern, readily-available 10-mbit/s Ethernet cards.

I've recently completed work on a project that delivers robust 10-mbit/s performance across an X-band microwave link at a reasonable price/complexity level, and wanted to post an announcement here to let any interested parties know of the results. The link has been in daily use for several weeks between my office and residence, and has worked great so far! Any feedback and questions are welcome.

Frequency and power will affect this more than anything, but you might install some ferrite donuts every so often along the length of the control cable. Might help-might not need them, but they probably aren't going to hurt, so if they are installed upon installation, it won't be a labor problem if you have to tear in again later.

Hi.... I am in the process of putting together a bunch of stuff that I've had kicking around here together to make a 4-1000 amp... I have at least a dozen schematics for GG amps but almost nothing for Cathode grid driven amps using the 4-1000. The only real drawback that I've seen so far is that it requires a slightly more complicateed power supply (screen voltage and the like) but I already have the stuff to incorporate that into it. The main advantage that I can see for this amp is that it takes very little drive to send a 2500 watt bird slug into oblivion (or at least to cause the needle in the meter housing this slug to gently tap the right hand stop pin). I can imagine, though maybe not rightly, that this amp may be a little more difficult to tame, parasitically speaking, but then I plan to swamp the heck out of the input grid circuit to knock down the input drive to a level that won't cause the tube to exceed the plate dissipation rating....in my way of thinking this would seem to knock down a "possible parasitic" enough to where it would never get started... where is Rich Measures when you need him...anyway, any info would be helpful I'm looking to start this project in the next 1-2 months....

I finally at long last connected up two separate ideas in my mind, and figured out something about antennas which I've never encountered before.

I've written it up here:

ENERGY-SUCKING ANTENNAS
http://www.amasci.com/tesla/tesceive.html

Atoms are far smaller than the wavelength of light waves, so how come they can absorb light so well? No, it's not a quantum-mechanical effect involving tiny photons hitting tiny atoms. Instead it involves classical EM. Most amazing is the idea that the same physics can probably be used to make very small Tx/Rx antennas.

Awhile back there was a furor about "Crossed-Field Antennas" (CFAs) which supposedly allowed us to transmit efficiently on 80m with a tiny desktop antenna. Well, that might not have been genuine, but I believe that the above "energy sucking" process can do the same thing. The key is to build a high-Q resonant system. It stores energy in the form of an immense EM field, and the field itself acts as the antenna. In other words, if an antenna is far, far smaller than one wavelength, we can still get the signal out by superimposing a huge e-field (or b-field) on the antenna in phase with the transmitter. The large field lets the transmitter couple itself to empty space. To do this, either use a loop antenna with a relatively huge current, or use a dipole with a relatively huge voltage. The antenna itself is far too small to be resonant, and so we add a corresponding coil or capacitor to create a resonator which allows efficient transmission. And for a receiver, if the antenna is actively resonating because of energy it had previously received, then that antenna receives MORE energy than a non-resonating antenna would.

Maybe all the hams here will say "NO DUH!" If so, then why would anyone care about those CFAs and their claimed ability to act as large antennas, while remaining very small? Also, why didn't anyone ever tell me that atoms act like electrically-small resonant loop antennas, and not like electrically large quarter-wave dipoles? I never encountered this idea in any physics class. Maybe only the amateurs know about it, while physicists do not.

Super-regen receivers as well as AM portables have apparantly been using this "energy sucking" effect all along. A resonant loop-antenna is NOT just an inductive pickup coil with a narrow-band filter. It actually behaves electrically far larger than its physical dimensions. And if two resonant coils are near each other, they can behave like a well-coupled transformer even though their mutual inductance is very small and the

distance between the coils is large. Weird! I bet this is no big news to radio designers, but physicists never have encountered such a thing.

Atoms, acting alone, do *not* absorb light well at all unless the
light's wavelength matches one of the resonances in the electron "shell" of that
atom.

A low pressure gas (or plasma) consisting of individual atoms all of the
same element will be almost completely transparent, absorbing no light, at most
wavelengths. At some resonant wavelengths, the gas will be almost opaque,
absorbing those wavelengths very well.

Your revolutionary breakthru is just a lot of wishful thinking. You
should stick to those things that you can demonstrate rather than things you
think you know that ain't so.

Your excellent writeup on holograms produced with a compass on a sheet
of plastic was a classic example of good science. This cross-fielded Tesla
stuff is a good example of very bad psuedo-science.

For good, simple passive grid amplifier that works with any tetrode, go
to http://www.oceanfree.net/ei9gq.

In case I've got that wrong, just enter ei9gq into Alta Vista.

No complicated screen supplies. Circuit is based upon the G2DAF linear,
which was popular here in the '60s, using 813's.

The only thought I have is to pick a time and day to page
her, and have all of the residents of the region stop and
listen for a page. I know that's a huge long shot, that it
is on, and somewhere where it could be heard. And you'd
need the cooperation of the police, and the local media, and
lots of random people. Maybe you could even get the local
pager companies to only page that number for some 10 minute
time period?

Grasping at straws, but a sad story. Good luck.

Just random thoughts

1851. How do you attached an LCD to the board?

The only phase noise consideration is related to the purity of the reference
oscillator.
The AD9850 DDS is a 125 MHz. part. If you use a 120 MHz. ref. oscillator, you will
be able to get a clean signal up to 1/3 of the clock or 40 MHz.
The AD9852 is good for 180 MHz. and has a built-in PLL clock multiplier that
allows you to use lower frequency ref. oscillators. This one should be able to
provide up to 60 MHz. operation (covering 6 meters) !

Hi guys/guyettes.
I've been told I can build myself a receiver for one specific frequency, and it's not too hard.
The frequency is: 5680kHz. Now, building the VXO is no problem, but the person told me I needed an IF... Where do I put this? I know if have an antenna, then feed the antenna into ??? then to the output of ??? I then add the VXO? then into my decector?
Is this at all right?
I want my IF at 455kHz. Can someone explain, via email what I need to do... none of my text books help.
Thanks in advance
Please help

There are more, and higher amplitude spurious outputs as your output frequency becomes a higher percentage of the clock frequency. You may get 80 dB of close-in spurious-free dynamic range with a 1 MHz output, but only 60 dB at 1/3 the clock frequency.

The clock-multiplier circuit generates a noisier clock. Injecting the actual clock frequency is better. It's just a little harder to make 180 MHz (can't buy THAT in a canned microprocessor oscillator). I'm sure they exist and will become common Digikey items eventually.

Never something for nothin' - Bill - W7AAZ

Thanks for your interesting story, Franz.
Many amateur radio operators like myself have lit up fluorescent
bulbs at close range to our transmitters. But I never heard of
someone living to a commercial station that had all of that energy
near by. I hope we hear more interesting stories about this on
this newsgroup; I think that the thread will be long.

In theory, multiplying a clock signal increases the phase noise by the multiplication factor, and dividing a clock signal reduces the phase noise by the divisor. If you start with a 15MHz clock and multiply it with an idea PLL to 180MHz and divide it with a DDS back to 15MHz, you would not see an increase in phase noise. I don't know how noisy the on-chip multiplier PLL is in the DDS, which is the issue here.

A 180MHz external oscillator almost certainly would require multiplying up a crystal reference, so you'd still see some increase in phase noise characteristics. Nothing for free, afterall :-)

Broadcast and your telegraphy are two completely separate licenses. You needed the telegraphy ticket to operate on a ship but the chief engineer for WABC in NYC never needed one for his broadcasting.

ARRL radio designer software works for me on a Win95A machine, but not on a Win95B (OSR2) machine.

I made copies of all the DLLs linked by ARRL.EXE from the system that works and put them in the local EXE directory on the other
machine. It made no difference.

When I told ARRL about this, they said -- "Yes. That's right."

I am thinking of getting EagleWare.

Has anyone tried VIPEC?

I have been using Eagleware's Genesys w/ Filter and schematic modules
for years now- the library is very extensive and modeling (using nodal
analysis) is very fast. The optimization routine is wonderful as is
Monte Carlo analysis. It is relatively inexpensive when compared to some
of the stuff out there, but it is easy to tie up several thousand
dollars to get started.

Yes, you can. You need a lot of antennas, and the regulatory authorities
would take a very dim view of your activity, but it is possible. There
were cases in the 1920s in Britain, when the Daventry transmitter 5XX
(200 kHz) first went on-air. Using neon lamps, no rectification was
necessary.

A looptenna generally has a core with mu much greater than unity. Are
you trying to make a case for atoms as transformers, with electron
orbits a single turns? Think of a nucleus as a coil core. What's its mu?
What's the mutual coupling between two orbits in different atoms? Small
quantities, small (not very useful) effects.

Why would they care? Don't commercial transmitter operators take a tax loss for "unavoidable signal absorption"? They certainly ought to. No real antenna can be sited for perfect radiation. Any signal lost heating a mountainside (or my home) doesn't help get the ads out, which pay the rent (and taxes). Don't electric utility companies do it? That 60 Hz heats a lot of ground... If a power company has to pay "cancer taxes" in California, could they sue for unpaid-for absorbed power from the "victims"?

I remember reading about a guy (may have been German) who was prosecuted
for powering his apartment from a coil hung out the window near a
transmitter. Apparently his efficiency was such that he cast a 'shadow'
- although maybe that's something that was claimed in court so as to
'simplify' matters for the jurors!

The crystal radio, with no power supply, is another example of this
phenomenon.

Agree with you 100% Dana. Multiplying up, then dividing down by the same number doesn't change the phase noise if the multiply/divide circuits are noiseless.

While well-designed multipliers seem to add very, very little additional phase noise, the same can't be said for a PLL. From another Analog Devices chip with 200 MHz internal clock multiplier:

"phase noise at 1 KHz offset, 40 MHz Aout"
REFCLK multiplier disabled : -115 dBc/Hz
REFCLK multiplier X4 : -105 dBc/Hz
REFCLK multiplier X20 : -90 dBc/Hz

Or, in English, with a CONTSANT output frequency the close-in phase noise increases when you use the clock multiplier. Disabling the internal PLL and doing relatively noiseless multiplication externally should give lower phase noise in the output signal. That's more complicated and I've not tried to figure out whether it would make any serious difference in performance of a ham rig. I'm a nitpicker, though, and would probably choose to build a diode multiplier if I needed a VHF clock.

I am a happy user of the Eagleware Genesys programs!
It is almost too fun to use, I never get round to build those
wounderful circuits that is so easy simulated....

The programs are really easy to use but I find the PCB design a bit
too crude. Maybe in the next revision it have a bit more professiona
feel about it, and still maintain the simplicity to use.

The biggest drawback is the form of licensing they use, both a
hardware key AND license mangager requesting new codes every year! One
can request a no-time limit s/w-key to let *YOUR* software function
but if you loose the key, kaputz!

Bottom line I would recomend the Eagelware to anywone, but for
hobbyists it is very expensive despite the offered discount (you must
mention your callsign when ordering).

Eagleware: If you read this newsgroup...what about promoting your
products by letting the ham community have cheaper access (200-300
dollars) to say an older version of your software?? Version 5.4 would
not be very attractive for the pro but would be heaven for us hams....

Super regen is just positive feedback.

AM receivers don't require highly efficient antenna's.
Their performance is more governed by signal to noise
ratio and in most populated environments, the dominant noise
is not in the receiver or antenna. Its external. The signal
to noise ratio is fixed before the antenna has any effect.

> It actually
> behaves electrically far larger than its physical dimensions. And if two

Well coupled means that M is not much smaller than sqrt (L1*L2)
where M is the mutual inductance and L1 and L2 are the individual
self inductances of the two coils.

> I bet this is no big news to radio designers, but

I think a physicist might say that an antenna acts like
a big atom, rather than the other way around.

If I used an SCR without rectifier diodes, I would have thought that this
will give only half wave rectification, and smoothing of the DC pulses would
be more difficult. As for the dimmer switch option, I live in the UK where
they are still expensive.

>Super regen is just positive feedback.

Super regeneration isn't "just" positive feedback. Ordinary
regeneration is just positive feedback. Super-regen involves positive feedback
with the feedback level set to cause the detector stage to oscillate *and* a
method to apply supersonic "quenching" to periodically stop the oscillation and
then allow it to begin again.

The quenching is usually done by biasing the oscillating detector stage
to cutoff which reduces its gain to zero and then allowing the bias to slowly
bleed off. The bias can be externally supplied or it can be "self-quenching" by
virtue of the oscillation its self. Such self quenching is also known as
"squegging". As the bias drops, the gain of the stage increases until it breaks
into oscillation. Any external RF signal present at the detector reduces the
time it takes to begin oscillating.

The external RF signal is converted to a sort of PWM signal. The
oscillations start and stop with the duty cycle dependant on the strength of the
received RF signal. Since the oscillations have a much larger amplitude than
the original RF signal, they are very easy to convert back to a DC level that is
a copy of the amplitude variations of the original low level signal. The
quenching is done at a supersonic frequency so that it can be filtered out later
or simply be ignored if we're just listening to the detector as a radio.

The end result is very high gain for the detector since it is always
operating with a high level of carefully controlled positive feedback.

I'm convinced that something very similar is going on in our ears. Our
ears are very sensitive to sound levels in the nano watt range. Recent reports
have indicated that some of the "sounds" like ringing and whistling associated
with a condition known as "tinnitus" can actually be measured with sensitive
microphones as sound generated *in* the ear. I think our ears are super
regenerative systems and that the annoying ringing in the ear that plagues some
of us is simply the supersonic bias dropping down into the audible range of
frequencies.

Jim

1895. Where to learn RF

Newsgroup: rec.radio.amateur.homebrew

From: Pete Riley <riley@sprintXmail.com>
Message-ID: <37B85509.3DF9@sprintXmail.com>
Source record: 67802

(WARNING: Anti-spam technique in place. Read the last line of this note)

I need to buy/design a circuit that will broadcast a simple (CW maybe) signal at very low power levels (I need to go 30 feet). I need to operate in either 390 MHz or 433 MHz. The transmitter will be left outside, so the temperature span must be fairly large.

Can someone recommend a source for me to learn how to design this circuit? Or (better yet) how about a company that I can buy a board, IC, or circuit from??

Thanks.

Pete Riley-remove the X from my address if you want to reply by e-mail

David OM,

You don't need an I.F. It is then called a Direct Conversion (DC)
receiver. See any QRP ham radio books or ham radio handbooks for
examples of simple DC receivers. You do not need a VCXO either, for a
fixed frequency.

I would like to hear from those of you that have
used 4E27's in grounded grid operation. I found a
military amplifier for 70 to 100 MHz that had the
tank coils removed, but most of it is still there.
And it would be easy to make an HF amplifier from it.
I'd put in 813's but I would have to replace the
filament transformer. And not enough head room for the
taller tubes.
If you have some useful information please let me
know. Especially if you had problems.

1901. Reworking Bird wattmeter slugs ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-16 00:00:00 UTC
From: Ham <hduff@ica.net>
Message-ID: <37B8A6DC.F506EBC5@ica.net>
Source record: 67808

The science of Bird Wattmeter Slugs;
I have a few questions that I wonder if someone may be able to answer...

1. How does the dimensions and proximity of the pickup affect frequency
range and power ?
��� ie...What differentiates the power rating of a 50 watt and 100 watt
slug
��� of the same frequency range ?
��� What is the differentiates the useable frequency range of a 50 watt
2-30
��� MHz. slug and a 50 watt 25-60 MHz. slug ?

2. Is it possible for the hobbiest to rework slugs ?
��� If came across some oddball slugs at a fleamarket that are
completely
��� useless at Ham radio frequencies, could I remove the pickup loop
��� and install one with the dimensions of another ?
��� Of course, I would need to have something decent to calibrate
against.

3. At what point outside the rated frequency range does the accuracy of
��� these slugs start to really drop ?
��� ie...could I use a 400 - 1000 MHz. slug to measure a signal at 1285
MHz.
��� with reasonable accuracy ?

Before you take the suggestion of a direct conversion receiver, I should point out that they do have limitations. One obvious one is that they aren't really a good choice for AM. If you are trying to receiver morse code or single sideband, then a direct conversion receiver might be okay, as long as the other limitations are acceptable.

For a fixed frequency receiver, I wouldn't do away with the VXO. There will always be variation, such as the ideal circuit the crystal is cut for and the actual circuit, or frequency change with temperature, or crystal aging. If you don't put in any means of slightly adjusting the frequency, you may have problems. That's why all those old commercial two-way radios had trimmer capacitors in series with each crystal, so it could be adjusted to be exactly on frequency. For a fixed frequency, you won't need a wide variation, but you will need to pull the crystal a bit, just in case.

This is robbery, of course. When I was in school, very close to
a transmitting station, we could have flourescent lamps light
brightly without a wall connection. It was necessary to short
circuit the lamps at night.
It was possible to drive our pocket radio with the energy from
the transmitter - but of course we did listen Radio Luxembourg,
they had much better music :-)

Odd, it runs on all of my plain vanilla systems. I haven't tried it on a real
antique, of course, but it does run on an old 486 running Win 3.11. That's
as antique as I have running anymore.

Hi Al,
I have taken it apart as far as the gearbox, two sets of planetary gears.
I think the output is about 150 rpms at full voltage. I wouldn't need any
additional gear reduction for torque but maybe for resolution. Or I could
use pulses to the motor.
I would like to use someone else's experience about pulling off the bit
holder, I don't want to pull it off and find that the (sun?) gear then
wobbles
in it's bushing.

A more cost effective solution might be to use a $3 lamp dimmer on the mains side of the power supply. I have done this. It works well for conventional transformer-diode-capacitor power supplies. Of course, be careful with more sophisticated power supplies.

If you really want to build it, wouldn't it make more sense to use SCRs to do the rectification? Otherwise, you have redundant diodes.

That would involve a lot of nerve activity in the inner ear in the
absence of sound, which AIUI, is not observed. The ear/brain system
seems to work like this (highly simplified):

The basilar membrane in the cochlea, in the inner ear, is a form of
band-pass filter array, like a graphic equalizer. Each filter has an
'inner hair cell' at its output, which sends nerve impulses to the brain
when the filter is activated by an incoming sound. The 'gain' of the
inner hair cell is controlled by a mechanical adjustment (!) via an
'outer hair cell', which in turn is controlled by nerve impulses coming
back from the brain. This is effectively an automatic gain control loop,
with a non-linear control law, giving the normal ear its logarithmic
response.

In a damaged ear with 'sensorineural deafness', the 'gain' of the inner
hair cell and the action of the feedback loop are compromised, usually
(AIUI) due to the loss of, or damage to, hair cells. This can have three
effects:

- loss of sensitivity at some (normally the higher) frequencies, if the
inner hair cells are lost or damaged.

- loss of the logarithmic a.g.c., leading to 'recruitment' - a linear
response to sounds above a certain level, which makes apparent loudness
increase very rapidly as sound pressure increases. This may be due to
loss of the feedback signal or loss of forward gain in the loop due to
damage to the inner hair cell.

- instability of, and/or noise generation in, the feedback loop, if
something a bit more subtle happens (I don't think this is well
understood at present), leading to tinnitus and actual low-level sound
emission from the ear canal.

At least, that explanation is consistent with observations, AFAIK, but
it is certainly a simplification.

I lost ALL hearing in my left ear due to a skull fracture in 1983...there hasn't been any invasive examination, but I've been told that the nerve was damaged, and irreversibly so. There's been no sign of substantial facial nerve damage despite the close proximity of same to the auditory nerve. I suffer from LOUD tinnitus 24/7. The loudness and frequencies vary...loudness can increase due to physical exertion and/or being in a high-dB SPL environment, and at random, which seems to be the way frequencies vary. My equilibrium was severely affected by this injury as well, and I think that, in the long term, such things as concentration, memory, and mood control have suffered as well...I look upon the ringing as a sign that my auditory center is still alive, hopefully awaiting that magical surgical technique which will restore my hearing. That's all now, because thinking about it and talking about it make me more aware of it...Murphy's law, I suppose.

Exactly. Because of resonance, an atom can present a relatively
enormous cross-section to incoming photons. As you say,
resonance is the key. That was a big thing with Tesla too, no?
What was missing is the fact that classical concepts have bearing
on atomic resonance. At resonance, photons can't pass by an
atom, even though the atom is hundreds of times smaller than the
wavelength of the light.

> Your revolutionary breakthru is just a lot of wishful thinking. You
> should stick to those things that you can demonstrate rather than things you
> *think* you know that ain't so.

Did you read Dr. Bohren's excellent little paper in AJP? Or
the one in the Russian physics journal? To me your response
seems rife with prejudice. You hear the word "Tesla" and you leap
to a stance of hostile disbelief? You don't need to examine any
evidence before rendering judgement? A dangerous
practice for people in science. But perhaps warranted in my case,
since I do have that enormous "weird science" section on my
website, and the pseudoscience is bound to leak out and infect
any nearby "proto-science" material! :)

All I'm saying is that resonant electromagnetic systems behave
electrically larger than non-resonant EM systems. It works for
atoms, and it works in LC circuits. It is supported in the physics
literature and I certainly wasn't the first one to wonder about such
things. It definitely is not my discovery.

"Good Science" involves verifying the references before leaping
to a stance based on beliefs and emotions. "Believers" have
trouble with gullibility, while "skeptics" have trouble with
closemindedness. A good scientist should be careful to avoid
prejudice against certain topics, *AND* to avoid believing certain
topics without evidence.

> Your excellent writeup on holograms produced with a compass on a sheet
> of plastic was a classic example of good science. This cross-fielded Tesla
> stuff is a good example of very bad psuedo-science.

I agree that the "crossed-field" stuff doesn't work. Read my
article again, and pay attention to my circuit analysis. That is
my "evidence." If you want to rebut my claims, then poke
holes in my reasoning, don't just apply disrespectful lables.

I'm not discussing crossed-field antennas. I'm saying that tiny
antennas can behave electrically "large" in the
same way that resonant atoms can behave optically opaque.
A high-Q resonant circuit is not just a bandpass filter, instead it
processes incoming energy differently than an untuned circuit.
Once the energy has built up in the circuit, we can draw off a
higher level of power than we could in an untuned circuit. This
seems highly counterintuitive to me, that's why I'm making such
a big deal about it. It makes me think "damn, Tesla was right about
this crazy stuff after all."

Hams have used tuned loop receiving antennas for decades. I
always thought that the tuning capacitor was just there to filter out
unwanted stations. On the contrary, it appears that a resonating
antenna can become "opaque" to incoming frequencies and absorb
far more energy than a simple untuned inductive pickup loop. With
a good low-noise front end this might be irrelevant. If you need
greater sensitivity, just crank up the gain. (Or replace your tiny loop
with a 1/4-wave dipole.)

But if we want to light a light bulb via an alternating electrostatic field,
then a tuned circuit can make your antenna reach out and "grab
power" from the nearby transmitter. This stuff is all entirely
conventional, and from my viewpoint as an electonics experimenter I
already knew about it. My "physicist" side just discovered what my
"electronics" side knew all along.

Watch out, I may have the last laugh!

What will happen is that everyone will realize that
this "energy sucking" stuff is entirely conventional.
It's just like sticking a resistor in a constant-current
conductor path and having the resistor get hot.
The high-ohms resistor "sucked energy" from the system,
whereas the lo-ohms wire did not. A tuned circuit
acts like a resistor, whereas an untuned circuit has
inductive or capacitive reactance only, and cannot
absorb much energy even if a resistve load is
attached to it. Simple stuff. Don't know why it
took me this long to notice it. But then, nobody else
noticed it either.

: Before you take the suggestion of a direct conversion receiver, I should
: point out that they do have limitations. One obvious one is that they
: aren't really a good choice for AM.

A tuned radio frequency (TRF) receiver might be used for AM, with a
crystal filter (one or two crystals) in the front end centered at 5680
kHz. For 6 kHz bandwidth, the loaded Q for the filter would have to be
about 1000, so the filter would have to be resistively loaded to drop
the very high unloaded Q of a single crystal. An IC intended for IF
amplifiers could then be used to provide sufficient amplification,
detection and generation of a.g.c. Since all amplification is on the
RF frequency, the receiver must be well shielded in order to prevent
any radiation back to the antenna. An ordinary LC filter might also be
required in the front end to attenuate the 3rd and 5th harmonic
response of the crystal.

In some fixed tuned 121.5 Mhz aeronautical search and rescue
receivers, a ceramic filter is used in the front end to provide
sufficient image rejection and an other ceramic resonator (at 121.045
MHz) is used as local oscillator to generate the 455 kHz IF. In this
way the receiver does not need any tuning during manufacturing or
maintenance.

Exactly. It is very weird in there. The impedance of free space isn't
an impedance anymore, and voltage and current can be manipulated
separatly. I never would have believed it if I didn't think it through
on my own (and if I didn't find some articles in a physics journal which
support the concept.) By adding an in-phase current to a loop
antenna, we can crank up the received power. It's very silly.
If it's real, why doesn't everyone know about it? For one thing, it only
works with short antennas. If you have a 1/4-wave dipole, you
already are presenting an enormous collection "cross section" to the
incoming waves. Whoda thunk that a little bitty antenna could do
a similar thing (if its Q-factor could be cranked up to immense values.)

> Depends where you went to school. Lots of "Physics Professors" never
> get past inclined planes and carbon paper. You obviously read a lot, so
> read more.

I've never stumbled across these ideas in any physics textbook
in my collection, but then physics textbooks don't tend to have much
EM except the very fundamental topics. This "energy sucking" thing
is much more like engineering than like physics. I don't recall
ever hearing it mentioned in my fields/waves engineering courses.
I would have remembered something this odd.

What's amazing to me is that the Bohren paper in AJP doesn't
reference an enormous number of similar papers, and also it was
published in the 1980s. Instead there is only one other paper that
discusses this topic (at least on the micro-scale version of the
phenomena.) That paper is also from the 1980s. Maybe there are
many papers in old engineering journals about this stuff.

> A looptenna generally has a core with mu much greater than unity. Are

> What's the mutual coupling between two orbits in different atoms? Small
> quantities, small (not very useful) effects.

Nope, I'm seeing that a single atom is similar to a coil/capacitor
resonator. Hit it with an alternating e-field, and if you match its

resonant freq., you will pump the electrons to higher states. Or,
do the same thing with an alternating magnetic field. Or just
shine EM waves of the appropriate wavelength at it. In any case,
the atom will NOT behave as an antenna which is << the wavelength
of the radiation. Instead it will absorb far more energy than such a
tiny object has any right to do. In particle-accelerator jargon, the
photon collision cross-section of the atom is larger at resonance. The
weird part is that a macroscopic coil and capacitor ALSO has an
enlarged collision-cross-section at resonance, even if it's the photons
from the 550KHz AM band that are doing the colliding.

> You know, that sounds loopy as all hell, but the diagrams are pretty
> convincing. Might influence us "lightning antenna" addicts.

Here's something that's far loopier. WHAT IF there are some relatively
coherent vertical AC e-field modes in the earth's Shumann cavity?
Driven by thunderstorms all over the planet? As I mentioned in the
article, radios might not detect these signals if they were using loop
antennas. Perhaps these signals do not exist (meaning, the signal
strength is low compared to the broadband hash.) But if they do
exist, then a long-wire antenna connected to some sort of high-
voltage resonant circuit might be able to build up a fairly large
resonance. If this occurred, the resonator would essentially be
"storing" a high-voltage AC signal, and building it up with time.
The same thing can be done with a "Franklin Antenna" connected
to a capacitor: if you wait long enough the, tiny DC atmospheric
leakage will charge your capacitor to lethal levels. But if it's done at
AC, then something weird happens: if we draw off some of the energy
from the resonator, we can obtain an unexpectedly large power.
The amount of power received by the antenna is larger if we allow
a big AC signal to build up in the LC circuit attached to the antenna.
Maybe hang a little pickup-coil around the coil of the resonator, and
light an LED from the Earth's net AC output from lightning strikes
everywhere.

All speculation. One would need to build a tuned circuit of VERY
high Q and capable of standing off a very high voltage, and then tune
it to various frequencies down below the commercial AM band.

Dr. Thomas Gold (lately of Cornell Astrophysics) came up with the same
theory. When he presented it to hearing specialists, they refused to take it
seriously. The event is described in Gold's paper "New Ideas in Science",
http://www.amasci.com/freenrg/newidea1.html where he outlines some of the
damage that peer-review and "concensus-think" can have on science.

a Win95B (OSR2) machine.

I have exactly the same problem. It crashes Win95b hard (ie: Hardware Reset
Required)!!!

>I am thinking of getting EagleWare.

I still don't know why you dont try Aplac. You get to simulate many things
for free
(before the memory
limitation takes effect), it is documented far better than Eagleware, and
is available
on the web at www.aplac.com

Okay, you don't get the schematic entry unless you pay, but if your used to
using ARRL, then you will find Aplac easy to use. Its also far more powerful
than ARRL. The other thing I like about Aplac is that the documentation
contains heaps of worked examples and results. I really can't reconmended
anything higher than Aplac for the experimenting radio amateur who
can't afford to spend money on simulation software.

I have no affiliation with Aplac, just a good experience using it at Uni..

Eagleware is also a very good program, and it used at my work for
almost everything. However, it would be considered very expensive
for an experimenter to buy, and you would only consider it if
you would be getting some finacial return from the software
(Unless you have cash to burn...HI HI)

<snip>

I took the liberty of examining one of these units, and the included documentation, at John's booth at the Bay Area's Foothill swap meet back in July.

Although I can see that the boards are clearly useful for some applications, be aware that they do NOT put out NMEA-compliant data bursts. The output format is most definitely proprietary (though it is thoroughly documented in the links referenced on John's web page).

In any case, this means that the receivers cannot be directly used with some popular mapping software packages, such as Chicago Map's 'Precision' CD, or with DeLorme's Street Atlas, that expect NMEA-compliant data streams. I suppose it's possible to construct some sort of format converter if one wanted to go to all the effort.

Caveat GPS...

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Take a series R, L, C circuit. Drive it with a constant
current sinusoidally alternating source.

It will absorb the same amount of energy whether
the L and C resonate with the source or not.

No, use the SCRs in a fullwave bridge configuration. This is used in
TIG welder power supplies to obtain precise current control.

Not sure what you are saying here, some numbers
may be useful.

Whenever you have a bunch of atoms in proximity,
they can "share" electrons so that the relevant
"size" is the atom to atom spacing rather than
the size of a single atom.

So are you speaking of isolated atoms, such as
in a low pressure gas or clumps of atoms such
as in a chunk of glass or copper wire?

It's easy to fall into the trap of confusing voltage with power. A high-Q tuned circuit in the presence of an RF field can deliver a high voltage to an open circuit, but since power is E^2/R and since R is infinite, the "captured" power is zero. As soon as you load the circuit with a finite resistance, the Q starts to degrade. Q of a small antenna is important because it is related to the losses in the circuit, and therefore to the efficiency of the antenna for either transmitting or receiving. But there is nothing magic about high Q antennas that will allow them to suck huge amounts of energy from an RF field.

It isn't difficult to estimate how much energy can be captured with a small, tuned loop antenna. The amount of *power* available to the receiver is equal to the incident power density times the effective area of the antenna. Power density in watts per square meter is given by E^2/377 or H^2*377, where E or H represents the field intensity. To estimate the effective area of the antenna, use the formula A(eff) = G*(wavelength)^2/(4*PI). G is the "real" gain of the antenna, which includes the directive gain and the efficiency. The program RJELOOP3.EXE by Reg Edwards can be downloaded from Reg's web site at http://www.btinternet.com/~g4fgq.regp/. RJELOOP3 includes a calculation of the Q and the gain (in dB) relative to a full-size quarter wave antenna. The gain in dB must of course be converted to power gain for use in the effective area equation.

For example, a 1 meter square loop wound with 20 turns of #18 (1 mm dia) wire has a gain of -64 dB (about 4e-7) at 200 kHz. The wavelength is 1500 meters, and the effective area is about 0.07 square meters. It's not going to "suck" much energy from a transmitter unless the field strength is really huge. Note that the Q didn't show up explicitly in my calculations; losses were already taken into account in Reg's computation of the antenna gain.

Ferrite loading of a small loop antenna can provide a very large improvement in gain. But a ferrite loopstick of practical size will still have very low gain. Radiation resistance of a small loop is proportional to area squared times the square of the effective

permeability, which is typically on the order of 100 to 1000. (Ferrite materials with bulk permeabilities above 1000 are available, but the effective permeability is much smaller than the bulk permeability except for very large length-to-diameter ratios). So a ferrite loaded loop can be a million times better than an air-core loop of the same dimensions. However, the area squared term kills you. An LF loopstick antenna wound on a 1/2 inch diameter rod is *much* less efficient than the 1-meter square air loop in the example above.

Yes, it's possible to capture energy from RF fields. A friend of mine has run a little electric motor with energy captured from 50-kW AM station WCCO, several miles away. But he uses a fairly long wire antenna, something like 200 feet if I remember correctly.

Good question. Let's see. If the EM system is being
"illuminated" with propagating EM waves, and the
waves have a certain power density P/(meter^2), then
an ideal quarter-wave dipole antenna with an impedance-
matched resistive load would intercept X watts, and we could
calculate the "absorbtion cross-sectional area" of that antenna
from X/P, and if we assume that this area is circular, then the
"electrical size" of that antenna is SQRT(X/P/pi)

If we do the same for ANY antenna, we can figure out
how "large" it is electrically, and compare it to the "size"
of an ideal quarter-wavelength dipole.

Yes, I was imagining individual, widely-separated Sodium
atoms in a vacuum, or the individual Chromium atoms in a
doped aluminum oxide (ruby) laser resonator.

Me too, I would like to find some numbers to apply
to this. Right now all I have is thought-experiments,
and the analyses in those two research papers.
(Isn't SCI.PHYSICS a great place? People start spitting
on an idea even before reading the references. In my
opinion, anyone who wants to "spit" on colleagues had better
check and see if their victim is 'beneath' them. If they have to
spit 'upwards', chances are that they will embarass only
themselves.)

Rather than looking at atoms, those authors looked at
IR absorbtion by particles with diameter << than the IR
wavelength. One of their examples involved surface
plasmons in metal particles, the other involved phonons
in dielectric particles. I recall that, for IR light in the
absorbtion band of the particles (i.e. at resonance,)
they calculated that the "electrical size" of the particles
was about 15 times larger than the physical size, as if
the particles were reaching out and "sucking" EM
energy from a large area around themselves. Very

weird. The authors then pointed out that this is a well-
known phenomenon in particle physics: at resonance,
the collision cross-section of a particle can be far larger
than its physical size. Another way to say it: at resonance,
the particle grows to fill the electromagnetic "near field"
volume. Obviously this only becomes significant for
particles which are << than the wavelengths being
absorbed. And when applied to circuitry, it only becomes
significant for small dipoles and loop antennas, where the
physical size of the antenna is << than the wavelength
being received.

Do the same for a parallel RLC circuit as shown in the
ASCII art in my "energy sucking" article. See what
happens? (Or perhaps I'm wrong about *ALL* of this
stuff, and I simply have not found my glaring error.)

That's what I thought initially. But look at my two examples.
When I load the untuned system down to V= .707x,
I get microwatts, but when I do the same with the tuned system,
I get watts. This is extremely counterintuitive. Just by allowing
a big voltage to build up, I should *NOT* be able to draw any
more power from the antenna, right? That's an understandable
conclusion. But unless there is a big error in my reasoning, that
conclusion is wrong, and it is possible to draw far more power from a
resonant receiver than can be drawn from an inductive or a capacitve
pickup alone.

That's the central point. I think that there *IS* something magic
about small, high-Q antennas. (Remain aware that this only
applies to small antennas. Connectiing a resonator to a
half-wave dipole should not increase the received power.)

>
> It isn't difficult to estimate how much energy can be captured with a

> of the antenna.

Exactly. Exactly. Check out those two physics papers. At resonance, the
effective area of an electrically-small antenna increases. At resonance, the
antenna no longer behaves as we might expect. The authors demonstrate this as
applied to particles being illuminated by IR light, but this is a Classical
Physics (non-QM) effect, and so it applies to EM devices in general. A tiny
antenna can "expand" its effective area into the nearfield region if that
antenna is a resonator. This does not apply to 1/4-wave dipoles and larger,
since those antennas are already dominating the area of the nearfield region.

> use in the effective area equation.

If that program does not include the effects of applying
a synchronised b-field to the nearfield region of the antenna loop,
then it does not include this bizarre "energy sucking" effect.

As I understand it, small resonant antennas rely on the
ability to apply EITHER an e-field OR a b-field to the
nearfield region, and therefor to affect the power seen
by the antenna. It's a nearfield-only effect. If we artificially
increase the current only, then the received power increases.
Impossible? Not if there's empirical evidence that this occurs.
"If it happens, it must be possible."

Please note: this is NOT my field of expertise, and there is still
a chance that this phenomenon is not real. If it wasn't supported
in the physics literature, I would insist performing my own
experiments before accepting that any of this is possible.

> Yes, it's possible to capture energy from RF fields. A friend of mine

As a kid we lived next to WENY in Elmira, NY. Crystal radios
worked very well, even without a tuned circuit or a longwire
antenna (although our selection of programming was somewhat
limited!) I can easily accept that a big loop or a longwire antenna
can intercept significant power. A small, high-Q tuned circuit might
build up a very large signal, and we'd expect that its impedance would
be so high that little energy could be withdrawn, but energy goes as
the square of voltage, and that is the key. Get your resonator going,
so the voltage goes way up, and you can withdraw a proportionally
larger amount of energy. Very weird. The phase-locked oscillating
fields around a high-Q resonator can distort the patterns of a nearby
transmitter's antenna: the "energy sucker" casts a shadow as
it absorbs energy from the transmitter.

Oh that one we drive with a constant voltage.

At this point I'm not challenging your conclusions,
but I think the analogies may not be stiff.

You may not be wrong, but what you have found may not be novel, just that your way of describing it is not the usual one. I wonder if you are thinking along these lines:

To take a practical example of a tuned circuit interacting with an external field, consider the 'passive amplifier' or whatever name you like to call it, which is a large coil tuned by a variable capacitor to the AM broadcasting band. You stand an AM portable radio, with a ferrite antenna, beside it and tune the radio to a weak station. When you tune the large coil to the same frequency, the radio gets louder, maybe much louder. (If the coupling is too close, the radio can be pulled off-tune.)

What is happening? Well, the current in the large coil sets up a local field which interacts with the transmitted field. Off-tune, the coil current is weak and has little effect. But at resonance, it is much larger, maybe 100 times larger, and it distorts the field pattern so that the field is stronger in the neighbourhood of the coil than it would be in the absence of the coil, but it's correspondingly weaker in other places. The tuned circuit acts as a *field concentrator*, which is a reasonably correct name for the device. There are no strange, unexplained effects, but a demonstration of the device leads people to look for concealed batteries etc., because on the face of it, a tuned circuit cannot do what it clearly does do.

That sounds like a definition that could be
made to work, maybe. I guess you wouild specify
plane waves from a source very far away? It would
seam that highly directional antennas for have an
advantage over less directional. Also, I'm
having trouble visualizing a non resonant antenna.
A log periodic comes to mind, but it is really
a collection of stagger tuned resonant elements.

I guess you come have a whip that was very much
smaller than a wavelenght, but to match it to a
load you would wind up resonating it. Maybe that's
the question; how do you have a non resonent antenna
that is matched to its load?

> If we do the same for ANY antenna, we can figure out
> how "large" it is electrically, and compare it to the "size"
> of an ideal quarter-wavelength dipole.

So now what does the "actual" or "physical" size mean?

Greatest dimension. Diameter of a bounding sphere?

And then we would get data showing ratioes of electrical
size to physical size for various antennas.

Hi,

picked up some surplus commercial VHF radios at a recent Hamfest and
wondered if anyone knew the bandwidth for the following crystal
filters:

HyQ "QF10701" and "QF10A7"
HCM "10M-4B"
Phillips "10.7N" and "10.7P"

Thanks in advance,

Richard VK5OO

ps - if these are of use to you then let me know!!

I'm trying to visualize what you're talking about. If it's an
LCD that lies on top of a "rubber tape" on the PC board, then
that rubber tape is actually the connection between the contacts
on the LCD and the contacts on the PC board. It's commonly called
"zebrastrip" because it has alternating layers of conductors and
insulators from one edge to the other. The supplier of the LCD
should have it. You could probably reuse the original if you
cleaned the contaminants from all surfaces.

> pickup alone.
>

Maybe we're just disagreeing on semantics. I think of the antenna as a source with a certain internal impedance (mostly reactance in the case of electrically small antennas). In order to extract maximum power from that source, it's necessary to provide a conjugate match between the source and load impedance. If we can arbitrarily choose the load resistance to match the "R" part of the antenna's impedance, all that is needed is a series tuning element (inductor for a short whip; capacitor for a small loop), and we're simply "resonating" the antenna. To match a fixed load resistance like 50 ohms usually requires a somewhat more complex circuit, but the net effect is the same. The circuit has to be tuned for optimum power transfer, and a small antenna (if it's at all efficient) will exhibit narrow bandwidth, meaning that it has a high Q.

>

You lose me with the synchronized b-field stuff. Sounds akin to the
"theory" of the crossed-field antenna, and I don't want to get into that
discussion. Catch a Poynting vector, put it in your pocket, etc.

Again, maybe we just disagree on what is "bizarre" Yes, it's hard to
visualize a small antenna with an effective area that is much greater
than its physical dimensions, but it's easy to build one. Going back to
RJELOOP3, let's increase the size of the loop to 3.16 meters square, and
make it from a single turn of 25 millimeter copper tubing. (The number
of turns in the loop has little effect on efficiency -- what counts is
the amount of copper.) Now the gain at 200 kHz is -36 dB, or
approximately 2.5e-4, and the effective area is about 45 square meters.
That's pretty good for a loop that has an enclosed physical area of only
10 square meters. And if we increase the size of the loop to 15 meters
(still only 1/100th of a wavelength) square, the calculated effective
area is about 4500 square meters -- almost 20 times the physical area.
That sounds pretty bizarre all right, but it's what one would expect

from some pretty standard antenna calculations.

There is an ongoing related thread on "capture area" in the rec.radio.antenna newsgroup, and it's obvious from the postings that the idea of a large effective area from a small antenna bothers people with a lot more antenna experience than I have. And the confusion doesn't apply just to electrically small antennas. I used to believe that my homebrew 2-meter "collinear" antenna (actually a combination of collinear and broadside elements backed by reflectors) was a better "receiving" antenna than a Yagi with the same gain. Intuitively this had to be correct. How could a skinny little Yagi capture as much signal as that big bedspring-looking affair? Observations also seemed to confirm this. The collinear picked up signals off the back and sides that a Yagi couldn't hear. But in my age and wisdom(?) I now concede that the homebrew collinear simply had a lousy front-to-back ratio and lots of sidelobes.

You've brought up an interesting solution.

Back in the late sixties, there were some articles by a VE7, Larry Walrod, about SSB transceivers with the crystal filter right on the signal frequency. Direct conversion without the audio image problem.

He ground surplus crystals to frequency himself to make the filters. I imagine it's more of a problem when you want the filter on an exact frequency.

Somehow I picture making filters for an exact frequency a bit more than many of us are prepared for. On the other hand, if someone got a big supply of identical crystals inside a ham band, it would be something interesting to try.

Around the same time, Hank Olson described a TRF WWV receiver for 15MHz. He had an FET RF amplifier, a single crystal filter (if I remember, the crystal was in series with the signal, with capacitors on each end, and a coil across the crystal), an IC IF amplifier, a detector and an audio amplfier. It made a lot of sense, since it's often nice to have a dedicated radio for a time station, and WWV operated on nice round frequencies where crystals were commonly available. One of these days I may get around to trying something like that.

Of course, one reason for wanting to receive WWV would be to adjust a frequency standard to zero beat. It occurred to me that that is a case where a direct conversion receiver would be suitable for AM, since you want the crystal right on frequency, and that's the only case where a direct conversion receiver is optimum with AM (leaving aside the matter of a synchronous detector where the PLL operates right on the signal frequency, which could be considered a form of direct conversion). Your frequency standard would be the the injection oscillator into the product detector. Before I had a chance to try something along these lines. there was an article that showed how to build that very thing in QST. It was about ten years ago.

I can't confirm this, having never tried it and never knowing anyone who
did, but I have seen warnings that soldering to these kinds of batteries
can cause them to "explode". Not sure just what that means or what the
results of such would spread around inside a piece of (expensive)
equipment. The ones I have seen like this look to me like the wires
have been "spot welded" in place.

Hope this helps in some way. Be safe :-) and kind to expensive
equipment ;-).

First, you should not be using audio cable, but coax cable that is
rated for radio frequency use.

It is possiable that the shield of the cable is not copper but
aluminum that is made to be crimped on and normal solder will not
stick to it.
Some of the cable tv cable is made that way.

Sounds to me like a wide range PI-net type output network. This should allow for a >wide< range of R+/-j to be transformed to the proper Z for the tube (xisitor), while keeping the loaded Q under control. If done with thought out values, this can be very useful. Many years ago this kind of design was popular, but seems to have fallen into disuse in this age of "50 Ohm" antennas.

Tell us more about the output device, B+ (or Vcc), freq range etc., and I could give more info.

Source record: 67739

Hello All,

Three pin 1 A voltage regulators: If a 12v regulator gets 12 volts on its output pin, while it has nothing on its input, will it come to any harm? Do they have protection if they find themselves being used the 'wrong way' around?

I'm designing a piece of gear that will be used off the mains supply and portable 12v. I have put a diode in series with the output pin to prevent external volts going into the IC, but this means a 0.7v drop, which varies slightly with the load, occurring when used off the mains with the IC in use, making the regulation poorer than if it were omitted!

Thanks,

G4JQT

<grin>, nothing like that :-), although that shouldn't matter to the
lawyers once they get the scent of blood, er ah, money :-).

I just happen to have a bunch of 4N38s and am looking for a cheap way
(yes, I am a ham :) to be able to make a cheap H-bridge type thing for a
little robot I am playing with :-), modified servos seem to leave
something to be desired, too much overhead for the processor I am using
doing PWM. More time and oddball parts than money these days :-). I
originally saved the schematic for that thing just for this purpose
"just in case" and now I have some time (and no money :) and "just in
case" has arrived :-).

Take care es 72/73, Vikki.

You are right, heat can make a lithium battery explode. It probably
won't be much with a little watch battery but don't try it with a "D"
cell unless your insurance policy is paid up.

1966. Help with spec on Motorola amplifier module.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-18 00:00:00 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <7pfe1k$hmn@nnrp1.farm.idt.net>
Source record: 67745

I have a General Instrument Starline X Series bridging amplifier JNBA-450RUN.1. Inside there is a Motorola amplifier module stamped with the numbers S134-129-01 404. Does anyone have any data on this module? I checked on the Motorola web site and had zero luck finding anything with this part number. I did find the CATV amplifier modules they have now, but these numbers are not to be found.

I would like to know what module can do and if it's worth while to save it for a use in a home-brew project at some time. I don't even know if the module itself is any good right now.

73's,

Aw come on! use a little common sense! There is no way that any battery
can "explode" unless you are totally careless with application of heat.
Any jerk that cooks a solder connection needs a facefull of electrolyte.
Usual care is just fine for most applications. Cliff K7RR

Lithium batteries have been known to explode when exposed to excessive heat. Don't do it. Check Digikey catalog for battery styles (CR2035) with welded tabs. You can also buy a battery holder for your Walmart battery at Digikey.

Announcing the Sixteenth Annual Odessa Texas Hamfest, sponsored by the West Texas ARC.
This year, as in the past, the Hamfest takes place on the 1st full weekend of November. This year, the fest is on November 6th & 7th. We expect over 2,000 in attendance over 2 days. Dealers come in from around the SouthWest.

We are one of the ONLY Hamfests that has ONLINE registration! You need not be present to win any of the major prizes, but must be present for the hourly door prizes. Over 200 tables should be filled as they were last year. Prices are reasonable & will remain so. We have hidden transmitter hunts & lots of fun. If you are planning on making a fest in the SouthWest this year, don't overlook this one!! Check out our website for more info on dealers, pictures from 1998, and prize info.

Check out our hamfest page at: http://www.wt5arc.org/hamfest/hamfest.html
Or, the main club page at: http://www.wt5arc.org
(where you will find the link for online registration)
Regular mailing flyers go in the mail in late September & if you are interested in receiving one, I need the mailing info by September 1st.
See you in November
Robert Jordan
Hamfest Chairman 1990-1999

If you're talking about the typical 7805/7808/Etc 3 terminal regulator,
it'll be toast instantly if Vout>Vin.
In the old days everyone knew that. (Myself, I learned that from bitter
personal experience. I don't remeber if the datasheets mention it.)

>I'm designing a piece of gear that will be used off the mains supply

Add the diode in series with the output. Add a similar diode from the
common connection to ground. The common lead will be raised by one diode
drop and the series diode will drop the output back to (within reason) the
original design value output. Be sure to add filter caps after the series
diode to reduce supply impedance back to a reasonable value and you may want
to add a resistor from the input voltage to the 'upper' end of the diode in
the common line to guarantee some level of current through that diode. As I
recall, the current coming out the common pin of 7805/7808/Etc is relatively
constant, in the 10-20 mA range. Check the data sheet.

==========
The advantage of NiMH batteries versus NiCad is their higher charge
density ,that's why they are popular for HTs and back pack equipment
, however their self discharge rate is higher than that of NiCad batteries.

A small particle or a photon cannot be used realistically in a thought experiment as though they were just smaller versions of golf balls. Photons, electrons, and atoms at temperatures other than absolute zero cannot be described as having a fixed position. The "uncertainty principle" must be considered. Those small particles have only a probability for being in a particular place, and they also have a probability for being anywhere in a volume much larger than their size would imply.

It's the interaction of the atom's "volume of probability" (tm) with the photon's volume of probability that makes them appear to have a larger area of interaction than their size could justify.

> And when applied to circuitry, it only becomes
>significant for small dipoles and loop antennas, where the
>physical size of the antenna is << than the wavelength

No. You cannot apply the same theories that work for submicroscopic particles to macroscopic things like antennas. The larger an object is, the more likely it is to not occupy a volume of probability larger than its self.

I'm surprised I have to explain these simple things to a science guy.

> source and load impedance.

Right. With perfect impedance matching, the antenna should absorb
all of the energy that hits it. But if this is *just* impedance
matching, then we wouldn't expect to change the effective area of the
antenna by very much. A high-Q antenna can intercept far more than
just the EM energy that hits it. THAT'S the "magical" part.

It might not seem like magic if we only raise the Q a little bit; only
making our loop antenna behave a few times larger than normal. But
in theory we could be using superconductors and high-value capacitors with
vacuum dielectrics, and making the Q absolutely humongous, and increasing
the effective size of the antenna by an impressive extent. Imagine a
little bitty device that sits on your desktop and totally wipes out
longwave radio reception for thousands of feet all around (on one narrow
frequency, of course) because its effective area has grown to, say, 1/10
of a wavelength? The coil inside that device might have mega-ampere-turns
of flux spewing out of it (remember, this is theory only, and maybe
difficult to do in practice, even if we use superconductors.) Because
it is phase-locked with the incoming waves, any field it generates
is going to seriously distort the pattern of the incoming waves.

A high-Q antenna is an oscillator. It's driven by the incoming waves,
and then stores their energy. As far as our instruments are concerned,
a high-Q antenna is surrounded by a powerful AC EM field. Yes, the
energy for that field was gathered from a distant transmitter
rather than from a local power supply. And it seems like coincidence
that the field is phased just right to "cancel out" some the incoming
EM waves for many meters around. This is the "energy sucking"
phenomenon in action. I still say it's counterintuitive: build a
powerful oscillator and adjust its phase and frequency so that it
cancels out the energy of EM waves which happen to pass by... and
the missing energy ends up inside the little oscillator?!!! It's the
reverse of radio transmission. With proper phasing, one transmitter
can steal energy from another (if they are in each other's near-field
region). Or, one transmitter can create a big shadow in the pattern
of waves coming from another transmitter, and the missing energy is
absorbed.

(Nasty cackle) if a number of high-Q resonant antennas were set up around any transmitter, in theory they could swallow the transmitter's entire output, even though the oscillators might be physically so tiny that they might be hard to find. To be oqaque to sodium-light, the cloud of sodium gas really doesn't need that many atoms!

> > If that program does not include the effects of applying
> > a synchronised b-field to the nearfield region of the antenna loop,
> > then it does not include this bizarre "energy sucking" effect.
>
> You lose me with the synchronized b-field stuff.

If we imagine a hi-Q resonant loop-antenna to be an oscillator which produces its own surrounding field, we will see that its b-field is in the proper phase to cancel a portion of the incoming waves (which really means "absorb them"). When the effective area of the loop antenna is made larger, it's because of this "oscillator" effect, not because we've matched the antenna to the load resistor. Although in a certain sense we HAVE matched the antenna to the load. We've matched it so well that the resistor is receiving far more than just the EM waves that physically touch the antenna.

> Sounds akin to the
> "theory" of the crossed-field antenna, and I don't want to get
> into that discussion. Catch a Poynting vector, put it in your
> pocket, etc.

Now I'm wondering if the "CFA" people were actually just building high-Q resonant loop antennas without realizing it? Maybe the CFAs do work, but not for the reasons that their supporters claim.

Here's one very interesting aspect of those two physics papers mentioned in my article. They give diagrams of the Poynting vector field surrounding the resonant particle. When an EM plane wave illuminates a resonant particle, the fields of the resonator superpose on the plane wave. The resulting Poynting-flow is bent inwards so it flows directly into the tiny resonator. If the fields created by the resonator are fairly intense (meaning that Q is very high) and as a result they fill a significant volume of space around the resonator with fields which rival that of the plane wave, then that volume becomes a sort of "lens" for the Poynting vector field. The plane wave becomes focussed onto the resonant particle.

I bet the same thing happens with Yagi director-elements. They set up their own fields which then divert the Poynting energy-flow and focus it on the active element. This stuff about the "energy sucking resonator" is simply a more powerful version of the "director" element of a Yagi. (But when the resonator is far smaller than the length of the received waves, and there is no large metal element, there's just a tiny "dot" that is generating a powerful field, and the energy flow is forced to focus upon that

little "dot.")

> There is an ongoing related thread on "capture area" in the
> rec.radio.antenna newsgroup, and it's obvious from the postings
> that the idea of a large effective area from a small antenna bothers
> people with a lot more antenna experience than I have.

I have very little antenna experience, so this "capture area enhancement" only bothers my physics intuition. But bother it does! Doesn't it mean that, if we are within maybe 0.1 wavelength of an AM tower, and if we are allowed to used superconductors in our antenna loop, that we can expand the "capture area" of our little antenna-coil to such an extent that it absorbs almost the entire output of that AM transmitter?!!! I can't help but think that it's weird. It's only NOT weird if we use low-Q circuits.

In your example with the 25cm copper pipe, what if we wound a 100-turn square coil with that pipe, so it weighed hundreds of pounds. At 200KHZ, couldn't we make a loop antenna that punches an enormous hole in the pattern of any plane waves which happen to be passing by?

> And the

> Intuitively this had to be correct. How could a skinny little Yagi
> capture as much signal as that big bedspring-looking affair?

Heh heh. We can use a large-area "solar cell", or we can use a little bitty solar cell with a great big lens in front of it.

My advantage is that I've
been reading those physics
papers. Sometimes the wave physics works at the
atomic level
and also at the macro-level.

It's clear that this is a matter
of wave-models versus
particle-models, and when the wavelength is long
compared to
our instruments (or to our thought experiments' size), then
the
wave-models dominate. I'm not saying that QM doesn't
raise its head when
antenna theory is applied to atoms or
to IR absorbtion by atomic clusters.
But it mostly applies to the
quantization of the energy being stored, and
not to the shape of the
EM fields surrounding the atoms. Although the atoms

emit and
absorb distinct quanta, when those photons are flying between
atoms,
they behave very much like radio waves. If I build an "energy
sucking"
resonator, it acts like a single atom, but it's an atom which
can store a
large number of quanta in a single narrow energy band.

face of it, a tuned
> circuit cannot do what it clearly does do.

Yes,
that's it exactly. One way to use a resonant antenna
is to wind a small
coupling coil around the inductor in the
resonator, so that
high-current/low-voltage energy can be
tapped off. By putting the AM
receiver's loop antenna near
the larger resonator, it acts as coupling. The
resonator works
its magic by supplying an enlarged "collection area" for
incoming
waves. Then the AM radio connects to it inductively.

The device
can only divert energy, not create it. However, I'm
amazed by the *size* of
the region of diverted energy. If the
Q is very high, the device can divert
the RF from hundreds of
feet around itself, limited only by the 1/4
wavelength radius of
the nearfield region. In the AM band, the nearfield
region is
around 300 feet in diameter.

If I wasn't being an idiot, I might
have called it a "field concentrator"
or an "RF lens" rather than an "energy
sucker." Got people's
attention, though! :)

In theory, if the "amplifier"
device had a high enough Q, the
fields around it might become so intense that
it would kill the
front end of the AM radio. In practice, I wouldn't be
suprised if
this actually happened to people who live a few blocks from a big
AM
tower. (Or maybe the coil within the "amplifier" would smoke!)

No, solder...8-)
Seriously. I use solder flux (e.g. alpha-metals write flux). Solder
the corner pins (does not matter , if You hit two pins). THis is
easier and IMHO better than glueing the chip onto the PCB. Then apply
solder flux and solder in one movement from the other corner. If two
pins were connected, chances are good, that the solder will be sucked
out again due to the flux. If not, reapply flux and use solder wick to
get rid of the excessive solder. If You get more and more experienced,
You will get results looking as good as if it were processed in a
reflow station. The most important thing is to avoid too much solder.

Have fun

It is interesting to look at the value of current in the final IF
transformer in a portable radio. The collector signal current may be 2
mA p-p and the loaded Q may be 100 (it ought to be less but selectivity
is more important that audio bandwidth!). So the current in the tuned
circuit is 200 mA p-p! In valve/tube receivers of yesteryear, currents
of greater than 2 A could occur, but the IF transformers were much
larger, of course.

The popular NEC or MININEC-based antenna modeling programs will probably
let you simulate this. Download the demo for EZNEC, NEC4WIN or NF (NF is
a stripped-down version of AO 6.5, used for near-field RF safety
evaluation). I know that in AO (or NF), you can specify any of several
common wire materials or ideal, zero-loss wires. Set up one antenna in
NF as a source with one or more "sucker" antennas near it, and do a
near-field analysis. You can get a tabulation of the field strengths in
the vicinity of the antennas, as well as the details on the current
distributions in every "pulse" in each antenna.

My own belief is that they simply built a small, high Q, end loaded
dipole with a lot of feedline radiation. It's possible to get better
efficiency (hence higher gain and greater capture area) with a short
top-loaded vertical than with a loop of the same volume, and certainly
with less mass of copper. I used to have a copy of a paper, probably in

the IEEE Transactions on Antennas and Propagation from 30 or 40 years ago, and probably by R. C. Hansen, that went through the math. Unfortunately I can't find the paper and am too lazy to search for the reference. It's just as easy nowdays to run a couple of models for the particular antenna geometries of interest.

Yep, you could absorb much of the power if you have a reasonably efficient antenna (fairly large or very high Q) close enough to the transmitter. But it would be easier to run a piece of coax:-) "Absorb" may not be totally correct, either, because some (probably half) of the power will be re-radiated. Again, this can be simulated with today's modeling software if you really want to explore the effect.

> > pounds. At 200KHZ, couldn't we make a loop antenna that punches
> > an enormous hole in the pattern of any plane waves which happen
> > to be passing by?
> >

It's easier to improve the efficiency of a small antenna by increasing the size, which is admittedly cheating, than by trying to reduce the losses to zero. That's because you have to contend not only with the losses in the antenna itself, but in any object in the near field. Ground losses are very significant in short verticals as well as in loop antennas in close proximity to ground. That places a practical limit on the efficiency attainable with very small antennas. No matter how high you make the Q, the best gain you can achieve with a small antenna is slightly less than that of a half-wave dipole. By the way, a 15 meter square loop with 100 turns of 25 mm pipe has a self-resonance well below 200 kHz, so it would be a lousy antenna.

I have a LowFER beacon antenna that consists of a top-loaded vertical less than 15 meters high, with a loading coil Q of around 600. The actual Q of the antenna system is between 100 and 200, depending on time of year and how long since the last rainfall. It's tuned to 186.75 kHz

and should have a reasonably large capture area, probably a few thousand square meters. Does it create a "black hole" for LF? Nope. In fact, because of re-radiation the signals on a nearby longwire receiving antenna are enhanced at frequencies near 186.75, in the same way that you can use a large passively-coupled loop to improve the sensitivity of a transistor radio.

You should not solder leads to these batteries as they generally will
not survive the heat. Usually, solder won't stick to the case anyway.
Tabs are normally spot welded to the battery case. I'd keep looking for
the proper battery.

1997. HELP! Tube Guru's Advice Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-18 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <37BADF60.AED359A3@midwestmicro-tek.com>
Source record: 67877

I finished building a CW, 75 watt, 80m transmitter last night. I uses the 1625 final and it is crystal controlled at 3.710MHz. I got the design from the 1967 ARRL Radio Amatuer Handbook. I've never built a tranmitter before and I have some questions about its operation.

After turning it on and then turning it off and installing the VR tubes so it would work properly then turning it back on again, I went through the tuning procedure described in the article. I used a 40 watt light bulb for the dummy antenna. After tuning around a bit I found that I could get the light bulb to light, but very dimmly. I guess that I had always assumed that the light should be very brite, is something amiss?

I attached my oscilloscope to the antenna output and found that thier was about 80 volts pp on the output signal and that it was at about 4.44MHz. After attaching the o-scope probe I also noted that when I keyed that transmitter it turned my color TV into a black and white TV with lots of fuzz so obviously it is transmitting something.

I think I have two probelms but they are probaly from the same error. First, the voltage output may be alright but maybe I'm not getting enough current? Second, how am I pulling a 3.710MHz crystal to 4.44MHz? Any help would be great.

Ah, conventional resonant dipoles are halfwave, not
quarterwave. A quarterwave dipole would be naturally
resonant at *twice* its quarterwave frequency, ie when
it is an electrical halfwave. A quarterwave *monopole*,
worked against a counterpoise (often the Earth) would
be resonant at its quarterwave frequency. The Earth
is a lossy medium for radio waves, however, so monopole
efficiency would be less than for the dipole.

The free space power density due to an isotropic source
is simply

PD = Pt /(4*pi*R^2)

Where Pt is transmitted power in watts and R is the
distance in meters from the source. PD is in watts/m^2.
If the source is not isotropic, then this figure has to be
multiplied by Gt, the transmit antenna gain over isotropic.

There is a formula for calculating the effective aperture
of a receiving antenna. It is

Ae = Gr * lambda^2 /(4*pi)

Where Ae is in square meters, Gr is antenna gain
with respect to isotropic, and lambda is the operating
wavelength in meters.

Gr for a full size halfwave dipole is 2.15 dB. Smaller
dipoles have a smaller Gr. For example, a 1/10th
wave dipole has a Gr of about 1.16 dB.

Ae is the same whether the antenna is resonated
or not. Obviously in the 1/2-wave case it is resonant,
but in the 1/10-wave case it is not, yet the effective
aperture is not grossly smaller. A 10 times size
reduction results in less than a 1.26 times reduction
in effective aperture. Resonating the 1/10-wave
antenna *does not* increase its effective aperture
(there is no term for resonance in the equation).
The idea that resonating an antenna increases its
capture area is simply false.

However, the amount of power you can extract
from the antenna does vary greatly depending
on whether it is conjugate matched to the load
or not. In other words, if the antenna has a feedpoint
impedance of Ra + Xa, the load must present the
conjugate of that, Rload - Xload, in order to extract
maximum power from the antenna.

Ra is the sum of the antenna radiation resistance (Rr),
which varies with physical size of the antenna, and the
antenna loss resistance (Rloss), which also varies with
the size and material of the antenna. X is reactance,
capacitive or inductive depending on sign, and Rload is
the load resistance, in the case of a conjugate match,
Ra = Rload and Xa = -Xload.

So whether an antenna is resonant or not doesn't have
anything to do with its effective aperture, but to transfer
the maximum intercepted power to a load, the antenna
must be conjugate matched. This has the effect of
resonating the *system* of antenna, feeder if any, and
load.

Now as mentioned, Rr decreases as antenna size
decreases. For small antennas, Rr becomes very
small (the relationship is not linear, it is nearly square
law when antenna length is much less than half a
wavelength).

Rloss is basically "copper" loss, and depends
on the gauge of wire used to make up an antenna,
the material of the wire, and its length. As antenna
size decreases, Rloss decreases linearly with

decreasing length, and increases to the square
of reduction in wire radius.

The ratio of Rr to Rr+Rloss is a measure of antenna
efficiency. As antenna size decreases below the
1/2-wave length, efficiency falls due to the more
rapid fall of Rr compared to Rloss. So electrically
small antennas generally have poor efficiency.
A halfwave antenna is often better than 90%
efficient, but a 1/10-wave antenna is likely to be
less than 3% efficient.

Now an electron in an orbital around a nucleus
can be considered lossless. So even though Rr
is extremely small, efficiency can be 100%. Thus
the behavior of atoms as antennas isn't the same
as electrically small copper wire antennas.

There's another factor to consider as well. The
ratio of Xa to Ra is called Q. As Q increases,
bandwidth decreases (an alternate expression
for Q is the ratio of the 3 dB bandwidth to the
operating frequency). So electrically small
antennas are very narrowband. This is carried
to an extreme in atoms, which exhibit very very
narrow *spectral absorption lines*.

In electrically small antennas, Q has another
unfortunate effect. As Q increases, the ratio
of circulating energy to available output energy
increases, ie the energy stored in the induction
fields of X become much larger than the energy
expressed across Rr. All of the circulating energy
is expressed across Rloss, however, so antenna
efficiency is further reduced as Q is increased,
due to this circulating current loss.

You can't win, you can't even break even.
The rules of the game are stacked in favor
of the house, and the intent of the house
is to maximize entropy.

That's probably because we aren't dealing with
constant current sources, or constant voltage
sources either. What we have in the field PD
is a constant *power* source, and that's a very
different matter indeed. To extract maximum
energy from a constant power source, we have
to present it with a conjugate match.

> Oh that one we drive with a constant voltage.

If you do so, you will miss the cool effects. Just what does
occur if we drive a parallel LC circuit with a constant
current at the resonant frequency? Analogy of an analogy:
it's like driving a capacitor with a constant current. The
stored enery increases, and the voltage across the components
increases, but the incoming current does not. Watts is VxI,
so the input power is increasing! Hang a large resistor
across that parallel resonant circuit, and you can extract
power, but hang a much larger resistor across it, and the
power absorbed by the resistor goes up. Even if the
constant current source is very feeble, the voltage across
the LC circuit is only limited by the Q. Because the available
power depends upon the voltage that has built up across
the resonator, we can design for extremely high Q and let the
V build up to an enormous value, which also cranks the output
power up to an enormous value.

In three dimensions, any analysis would discover that the
small LC circuit is pulling in energy from a vast region around itself.
If we didn't know what was going on, we would be very
confused by a small LC circuit which apparantly has broken into
oscillation all by itself, and which is not quenched even if we
use the thing to light up a lightbulb. (Hey, there's a good idea
for a "free energy" hoax. Maybe Joe Newman accidentally
has built himself a 60Hz resonant "energy sucker")

>
> At this point I'm not challenging your conclusions,

> but I think the analogies may not be stiff.

True. The circuit in my article is a one-dimensional analogy for a 3D phenomenon. In practice, even an infinite-Q superconductor circuit would reach a limit on its voltage when the AC e-field surrounding the resonator became so large that the distant transmitter could no longer send any energy in that direction. Or, if the resonator was outside the transmitter's nearfield region, then the resonator voltage would finally stop rising when the surrounding e-fields became so large that most of the power in the nearfield region was being intercepted. If the e-field is the "antenna", then that "antenna" can only grow until it's around 1/4-wave at the very most.

At long wavelengths and significant transmitter power levels this would be a very, VERY intense local e-field, since it essentially has to affect all the "incoming" e-fields at the "surface" of the nearfield region. What's the nearfield region at 10KHz? Something like 20,000ft diameter? Yow! Nikola Tesla claimed to have lit a large bank of incandescent bulbs (hundreds of watts) at a distance of 60 miles from his transmitting tower. If he used a big, heavy, hi-Q circuit connected to a capacitive antenna, and if the ionosphere was keeping his (10khz???) transmissions localized to the planet Earth, then perhaps his claim is not as bogus as everyone seems to assume.

An ideal "energy sucker" a few inches across in theory might be able to swallow most of the output of something like Voice of America, but in practice it would probably be shorted out by massive corona discharge-arcs long before it reached that level of operation. Therefore, wind it on a big coil form while thinking in terms of high voltage and corona losses. Put a large sphere on the tip of its antenna. Extract the energy via a coupling loop around the coil . We end up with something that looks exactly like a Tesla coil, but instead of a power supply, it has a bank of light bulbs (or perhaps a high-speed rectifier and a bank of batteries.) It's really just a great big atom that's hoping to intercept any passing photon which happens to match its resonant frequency. An "Atomic Energy" technology? :)

If Tesla had his way, our current civilization might look just like those 1930s visions of the future, with gigantic high-voltage coils and sphere-antennas springing up everywhere, and making all our cities resemble the innards of a radio transmitter. Me, I just want my own RF-powered personal jetpack. (And hope that the main transmitter doesn't blow a fuse!)

2004. Help Plse: trying to find circuit from 73 mag several years ago...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-18 00:00:00 UTC
From: Victoria Welch <vikki@oz.net>
Message-ID: <7pevql$ho0$0@216.39.144.179>
Source record: 67884

Hi all and thanks in advance,

I've looked around the net for 73 magazine but with no luck, I can't imagine that old "on top of everything" Wayne Green isn't out there, but who knows. If there is a URL for it, I'd apreciate knowing. Assuming it still exists...

A number of years ago, 73 published a schematic for a "blood purifier" or something along those lines that might have / did / could "cure" diseases using around 27V going though something like an "H-bridge" using 4N38 opto-isolators a couple of transistors and some miscellaneous parts. I'm working on something that needs that basic functionality. All my 73 magazines have been left behind in moving so I do not have the article anymore :-(.

If anyone has this, I'd like to get the circuit. Appreciate any help, circuit diagrams, descriptions of it or pointers.

Thanks & take care, Vikki.

I would be inclined to advise against this approach. Using such an
adaptor will add lead inductance which could adversely affect
the performance of the device. As has been pointed out, TSSOPs
can be solderd by hand, with care and the right technique.

However, solder paste and hot air reflow are the best way to
deal with SMT components.

I built a power supply for my Argosy back in '82 that uses 2 LM338k and an LM741 to supply 5-18 volts at 8 amps. I took the circuit out of some application notes from National. The power supply has been used on many radios, and is still the main power for the shack. It also has helped me get the car started on occasion. The op amp is used as a comparator balancing the load between the two chips. Needless to say, it works very well!

So, the answer is a qualified yes. You can, but it takes a bit of additional circuitry.

It runs ok on my Dell XPS M200s , a 200 MHz Pentium computer using
Windows 95 version 4.00.950B. However, I had some problems with QST
View (CD's providing back issues of QST). I couldn't read all of the
instructions without computer problems. I contacted the ARRL and their
fix didn't work. No problems looking at the QST data, however. I guess
you shouldn't purchase ARRL computer products if your purchase
approach doesn't provide a method for money back returns.

This brings up the question: What happens to a resonant antenna
when the illumination stops? Or starts?

The effective size of the antenna would be indicated by how fast the
energy in the resonant circuit builds up over time, not what its
steady state value ends up being.

2018. PC templates for recent QST or Handbook projects??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-19 00:00:00 UTC
From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <87iu6cw8xo.fsf@mongrel.kd6pag.ampr.org>
Source record: 67757

Last year, i designed and fabricated my own PC card, and just recently discovered i needed a level shifter (TTL <-> RS-232) to control a Yaesu transciever. So i checked the current ARRL handbook, a good project, but no artwork! Checked a QST recent article and same deal. I tried the ARRL FTP and WWW sites; there was PIC code (some source, some binary) and a modest amount of other technical information. But no PC artwork. Have i simply been looking in the wrong place? Or has the trend toward 'appliance operators' and a focus on HF operation really impacting taken its toll in terms of homebrewing within the ARRL? Is it really the case one now needs to order PC cards from a commercial vendorts and that this artwork is no longer readily available? (Except possibly via the U.S. postal service at the cost that to non-members at least, is no longer worth the time and trouble to make one's own PC cards for reasonable current projects.) Please someone tell me i'm wrong and the data is on-line. And what is happening to homebrewing these days??

Oh, well. I'll wire up the darn thing by hand. *Sigh* Too bad i don't have a wire-wrap gun handy; no good for RF, but fine for TTL and some ECL with a decent prototype board. *Sigh* Oh, well. Such is life.

> omitted!

The preferred method (covered in AofE) is to put a diode across the reg such that it is reverse biased when the input is powered up. When the input is down, the diode charges the input caps and prevents the current from flowing through the reg. No extra voltage drop involved.

I just retrofitted our 2M repeater for this, they take the battery to the output side of a 7812 through a single diode (to keep the 7812 from trying to charge the battery), which puts it in the same condition you describe if the AC line input is dead.

If you break down the internal current limiting, you'll be mightily suprised.
I've seen them go, Thionyl Chloride is NOT something you want to be in the same room with.

It's not possible to get the surface of the battery case up to soldering temp without damaging the battery. Use a holder, or get a battery shop (batteries plus or similar) to weld on some tabs for you. The welder has enough dTemp/dTime to do it without problems.

PBL3717 (Ericcson or Unitrode) chips make a nice current-regulated H bridge, one chip per bridge, 600mA or so, depending on heatsinking. Making an H yourself is a bit tricky, when you consider shoot-through. Can be done though, you have to watch that the "A" pair is completely off under all conditions before the "B" pair turns on.

National has an H bridge too, but not so much functionality on the chip, and it's $

>use the thing to light up a lightbulb.

But it would be, of course. The large currents which flow in a driven tank circuit are simply energy sloshing back and forth between E and B fields. Hook a light bulb across and that energy is used up and disipated (no differently than if you'd charged a big capacitor to max voltage and with a small current limited voltage source, and then used it to briefly light a high watt bulb: yout tank circuit using the same size capacitor will store exactly that much energy and no more).

Practical superconductive tank circuits are limited in storage energy by the amount of voltage the capacitor can take, and what its capacitance is (E = 1/2CV62), and by how much current (I) a superconductive inductor can take (E = 1/2LI^2) and not quench and go resistive. These things don't suck energy from anywhere except their own fields. They can store energy from trickle AC sources of sufficient voltage but limited current, but then so can a simple rectifier and capacitor.

Put a rectifier diode between the input and output pins. Connect the
cathode to the input (pin1,) connect the anode to the output (pin3.)

The diode will limit the maximum reverse voltage to 0.7V.

You're totally wrong on this one, Cliff. I've seen videos of tests done
by a battery testing house for the Gov't on various sized lithium cells.
You'll get a lot more than a face full of electrolyte - try a face full
of flames! That's one reason you can't legally transport a "D" sized
lithium on a pasenger aircraft. In addition, the gasses from a venting
lithium cell can close your airway in a matter of seconds - bad news if
you're in a confined space and can't get out. A shorted lithium cell can
have the same result - that's why the newer types have internal fuses.

By the way, superconductors are zero resistance only for DC.
For AC they have a small positive resistivity that is frequency
dependent.

I cannot give the technical advice given by others to your question ----
but --- as far as your concern about the .6V diode drop you can put in
another diode parallel and cut the loss in half.

How do you figure that? It's a junction loss (quantum effects) not a
resistive loss.

Go to Batteries Plus. Surely there is one of their stores in your area.
Get the right battery from them and they cold-weld tabs on at any angle that
you want. They've got the right equipment for the job.

No you can't. Diodes don't work like resistors. Put 10 diodes in
parallel and you still have .6V drop. The diode with the lowest drop
will set the voltage and the others will not conduct.

I have a three quarter inch hole through a circuit board and a metal case
that says you're wrong. The lithium button cells *can* explode. What happens
is that the heating from soldering causes the cell to fail internally shorted.
All those joules stored in the cell are then released all at once. Very
pyrotechnic.

```
List Of Stamp Applications (L.O.S.A for short)
==============================================

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in
the L.O.S.A form on the Web-page...

http://www.hth.com/losa.htm

The latest version of L.O.S.A is always available at the above
mentioned both in ASCII and in ZIP-file format for easy download.
An index of L.O.S.A is posted to the following mailing lists and
news groups, I will update it approx. once a month.

Mailing lists:

> dependent.

The resistivity at any frequency besides DC is also temperature dependent. The newer high-temperature superconductors have to be cooled way below their critical temperatures to keep RF losses low. Of course, the resistivity of ordinary metals is also temperature dependent, and copper's resistivity is very low at cryogenic temperatures. I haven't followed this for some years, but the earlier high-temperature superconductors had a hard time beating copper. I'm sure they do it pretty handily now, though, since they've greatly improved the grain structure which was a major cause.

Source record: 67778

Your problem is attenuation. For pure fresh water, the attenuation is about 0.2 dB per meter for just about any frequency above about 250 kHz. Below that frequency, it will begin decreasing about in proportion to the square root of the frequency. Salt water is a different story. In salt water, the attenuation is large and rises as the square root of the frequency up to about 1 GHz, where it finally stabilizes at a very high value. Here's the attenuation at a few frequencies:

Freq (MHz) Atten per meter (dB)
0.1 12
1 39
10 121
100 369

You get the drift. This is why VLF is used for submarine communications.

I don't have any idea what you might encounter for a typical pond, lake, or river, if that's your interest. Unless it's extremely pure, it would probably be much lossier than the pure fresh water value.

You might consider communication with sound waves (sonar), which propagate with much less loss in water.

Hello,
I am wondering if I can use 3 pin regulators properly heatsinked in parallel to increase the output current capability assuming the input current is available?

How would each regulator compete against one another to set the output voltage? I've used a common current and voltage source and several parallel regulators of differing voltage ratings to get a multiple voltage supply, but never
used more than one regulator for a particular voltage.

Thanks in advance.

2042. Re: 3 pin regs in parallel?

No, but you can use an external transistor to handle the excess current.
Most of the regulator mfgs. have tech notes on how to do this. The ARRL
handbook also has some info on this. Basically, for a positive regulator
it is using an NPN transistor with the collector to the regulator input,
the base to the regulator output and the emitter to your load.

I have no idea of the level of the class, but assuming it is fairly low,
Rat Shack puts out the Engineer's Mini-Notebooks by Forrest Mimms III,
which have some interesting projects scattered about that don't get too
complex :-). Might be worth a look - quick - simple, fairly cheap and
available.

Hope this helps in some way.

Take care es 73, Vikki.

Source record: 67696

A more relianle approach to increasing the output current of three pin regs (i.e. the 78XX series) would be to use an external "Pass" transistor. You don;t say how much current you need but 5 to 6 amps are easily achieved with the addition of a single transistor and a couple of resistors. Need more current? Just parallel more transistors. A note of caution if you choose the latter option...it is recommended that one use emitter ballasting resistors to ensure propper current sharing in the case of multiple parallel pass elements. It is also possible with the addition of a couple more components to retain over current shutdown protection. I have used this approach for applications of upto 30 to 40 amps.

As a source of info I would suggest National Semiconductors' applications notes or their apps manuals it yhey are available to you. If you are unable to locate these sources I can probably find a copy and scan it if necessary.

Good luck,

Bob

Source record: 67697

I maybe should give some more info....

The range required to be covered would normally be 600 - 700 metres.
I require to send data from various sensors upto around 100 metres
down, i would like a high a data rate as possible so as to send new
data at least once per second.
The data per sensor is 6 bytes long and there will be 6 - 8 sensors,
the whole lot being read by a microcontroller which in turn will
transmit the data to the surface receiver via, now i know the
attenuation figures, a vlf link.

Next question is, what frequencies can i use that i can get parts
(i.e the transducers) for fairly cheaply. I would really like the
transmitter / receiver sections to cost under £60 if possible
(keeping the whole package under £250).

I am an experienced electronics technician so building and testing
these units is not a problem, though i admit to knowing absolutely
nothing about underwater communications.

Thanks for the info so far

PLEASE keep it coming!

Steve H

Soldering to it will destroy it. These are normally spot welded. Look
for a place that specializes in batteries; around here there is a
"Battery Mart" which can do all of these spot welds.

In the worst case they can tear off the tabs from your old cell and
reuse them on a new one.

A good point, especially if the resonant circuit has
no load (infinite Q). On the other hand, if the Q
is finite, then the effective size should depend on
the intercepted energy. If I can coax my antenna into
intercepting more energy per second, then that antenna
has a larger effective size. The energy stored in the
resonant system is besides the point.

Obviously true.

>Hook a light bulb across and that energy is used up and
> disipated (no differently than if you'd charged a big capacitor to max
> voltage and with a small current limited voltage source,

Not so obvious. Yes, if the tank circuit was not connected to
an antenna, then the only available energy would be in the
tank circuit. When the antenna is connected and energy
is being received, something very odd occurs: the received
energy depends on the voltage/current which has built up
in the tank circuit.

Please refer again to the ASCII diagrams in this article:

http://www.amasci.com/tesla/tesceive.html

As a voltage-mode receiver (capacitive antenna, not loop antenna)
we find that, as the voltage builds up across the tank circuit, the
current being injected into the antenna does not fall fast enough,
and so the total energy coming into the tank circuit is higher when
the voltage across the tank circuit is higher. Very strange effect,
unless we imagine the incoming radiation to be a constant-current
source. When any load is connected to a constant current source,
the amount of received energy is larger when the voltage across the
load is larger.

Yes, we might expect that when the voltage builds up across the
tank circuit, the incoming current should fall equally, and the incoming
power should remain constant. As far as I can see, this is NOT what
actually occurs. (Yes, I do need more evidence than just some

physics papers which support the concepts.)

> Practical superconductive tank circuits are limited in storage
> energy by the amount of voltage the capacitor can take, and what its
> capacitance is (E = 1/2CV62), and by how much current (I) a
> superconductive inductor can take (E = 1/2LI^2) and not quench and go
> resistive.

Very true. A worthwhile device might take the form of a thin
superconductive pipe wound into a very large coil, and using
the turn-to-turn spacing as its capacitor. Very expensive to
build and maintain!

>These things don't suck energy from anywhere except their
> own fields.

Please track down the Bohren paper and the paper in that
Russian physics journal. Don't believe me, go and see what
the physicists say about this. They show that resonance
can increase the area of EM wave interception of small
"antennas" by unexpectedly large amounts.

As long as I sit on my butt and theorize, and don't build
any actual equipment, all this stuff is a matter of belief
versus disbelief. If you are dead certain that a tank circuit
cannot make a small antenna "suck energy", then that is
irrelevant, since only an experiment can demonstrate whose
beliefs are accurate and whose are faulty.

Now THAT's good to know about. Might you know the
mechanism behind this resistivity? If it involves flux-pinning,
then it probably only applies to type-II SC materials.
(We'd have to build an 'ideal' resonator from lead and
use liquid helium as coolant.)

I don't think the way described above is the best way to do it, or even advisable.

A PNP transistor is commonly used with the collector to the (positive) regulator output, the base to the regulator input and the emitter to the raw voltage from the reservoir caps.

Better look it up in a good book for all the details.

The original question was describing a very strange way of handling regulators.... Parallelling regulators ... with different design voltages? I think it's unsound design practice to even connect regulators in parallel that have the same design voltage. I would have to re-read the original message to appreciate it fully.

There were plans about 30 years ago for a radio controlled submarine that could be used in a swimming pool. You used a standard 11 meter band radio control unit with I believe an antenna wire laid into the water. Today, I see occasionally articles in ship modeling magazines of model ships and submarines being used on large ponds. You might try the local magazine shop to also get leads from people that have actual experience.

Thanks for all the usefull input! We've decided to not attempt to solder the Wal Mart lithium battery (Although we've soldered to nicad battery cases in the past). Someone suggested Mouser as a source and indeed they have no minimum and only charge actual UPS costs. They have CR2450 leaded versions (not an exact replacement) for $2.20 and holders for the non-leaded version for 86 cents. We've ordered both, so we're well covered :-)

Hi Steve,

Don't know if this is the way you want to go but a few years ago I help
a company doing about the same thing that your trying to do. They want
to get information from the bottom of a 4000 ft drop in the Atlantic
They eventually wound up using an RS-485 link. The only problem with
that is ofcourse that it is a wire link and not a radio link. Most
RS-485 Stuff is good for up to 5000 ft or about 1600 metes. I don't know
if you can use a "teathered" link but it would certainly be more
reliable and keep the cost down.

Capacitive antennas normally *are* current sources. For example, a wire
antenna with capacitance of 50 pF at 1 MHz is 3.2 kohms reactance,
whereas the resistive part is a few ohms.

Thanks for the reply. Unfortunately i MUST use a radio link, not a wire link.
I am going to try amplyfing the signal from our signal generator upto
around 1 watt and using a shortwave RX to test attenuation per metre
according to frequency.
We have a lot of sea lochs up here in the western isles, so finding a
quite sheltered spot will be easy.

For audio output, you really need a metal 6L6 (better yet, a pair) to learn the true meaning of "hot". It also gives a pretty good idea of "loud". A metal 6V6 could be used, but REAL MEN use 6L6s. You can't see 'em glow, but there's no problem convincing yourself that they are.

Source record: 67639

Hi Nate.
Don't panic. The "conductive elastomeric connectors" (I think that's the name) are designed to just be squashed between the PC board and the conductors on the LCD glass. At work, we purchase LCD glass and use this type connector to make the electrical connection to the board we make. No adhesive should be used. There should be a bezel or some other type of hold-down to keep the pressure on the sandwich of the LCD, connector(s) and the PC board.

Note that the connector is actually a series of conductive and non-conductive layers standing up on end, so that any conductive adhesive would short the conductors together and the LCD would not work.

Martin Ronney, WB6YMI

Martin is correct. I have also seen the phenomenon which you
mentioned, "the LCD was firmly attached to the rubbers".
Without being scientific about this, sometimes materials that are compressed
against each other for a long time stick to each other.
I have seen this happen with rubber quite often.... oil filter grommets,
old car radio clutches for the tuning assembly, etc.
I'm not sure if it is due to molecule migration, but the "zebra strips"
(or conductive elastomeric connectors) are held in place only by
compression.

Nate, did your original LCD crack? Just curious what the failure
mechanism was.

2080. Miniature Metal Lathe, Attachments

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-21 00:00:00 UTC
From: James Parsons <k5rov@earthlink.net>
Message-ID: <37BF4D63.DE490032@earthlink.net>
Source record: 67641

I have an Emco Unimat-3 metal lathe complete with most accessories. I bought this new some years ago and became ill shortly after. I put some use on it but not much. I have kept it sprayed with WD-40.

Some attachments have not been used. The attachments include three jaw chuck, four jaw chuck, thread cutting attachment with three of the most HAM used followers (others available from retail outlets), milling table, faceplate, steady rest, taper turner, power feed attachment, vertical milling attachment, vertical fine feed attachment, dividing attachment, spare cutting tools, and more....

I also have the original manual and some applicable manuals. Also included is a vertical/horizontal metal cutting saw, Professional quality micrometer, combination square, inside and outside calipers, dial test indicator, dial vernier, and more...

I have three or four boxes of steel stock, aluminum stock, and there may be some brass stock also, but I have not looked.

I have 2200 dollars in the lathe and accessories alone. Of course, now they are used. My health will not allow use of these tools, so it is time to get rid of them.

I would like to work out a trade for an Icom 756, or I might sell. But here is the problem...it must be picked up only. Its small, but heavy when the stock is included. And, I would not be able to pack it. I live in San Angelo, Texas.

I have to go to the hospital every week for chemo, and may not answer right away. I am here on weekends but usually gone during the middle of the week.

Test Equipment FS:

Keithley 169 Digital Multimeter, Lab type, but powered
by 6 "C" cells, so can be used in the field, if desired.
Nice large LCD display. $ 125

Heath IM-2400 Frequency Counter. Good to over 500 MHz.
Handheld unit. $ 60

Heath low voltage power supply. It is the Heath IP-27. It is a
low voltage power supply, fully adjustable from about 0.5 Volts to 50
Volts. It also has current limiting that is built in and adjustable
from a couple ma up to 1.5 amps. There is also a nice large meter for
measuring current or voltage. The supply is "floating", so can be
used for either plus or minus supplies. It is the "Heath Brown"
color. Manual included. $100

Prices do not include shipping from Florida.

E-mail to W8EK@fdt.net

Thanks.

Source record: 67727

If you want to hook them up as a 350 - 0 - 350, there should be no problem. Just pay attention to the phasing.

If you hooked them up as a 0 - 350 - 700 you would have to worry about the primary to secondary breakdown voltage.

44 kHz ultrasonic transducers are common, used to be standard
for TV remote controls before IR took over. There are special
transmitter and receiver chips to communicate data with these
things available too. As most everyone has told you, RF from the
depths is a serious problem. Ultrasound is a better approach.

Different chemistry, and it's not good for the nicad either. It just
dosent' immediately destroy the cell, or cause it to explode in your face.

While ultrasound certainly is a good alternative to radio
transmissions, there may be problems, if there are layers of water
with different temperature or salinity. The sound might not reach the
surface, but instead, it might be refracted in a similar way as radio
waves are ducted in the troposphere.

On the other hand, the problem with LF/VLF, which propagates to some
degree in the water, is that the antenna has to be quite large to give
reasonable efficiency.

ke4zv@bellsouth.net (Gary Coffman)
shared these priceless pearls of wisdom:

->
->Odd, it runs on all of my plain vanilla systems. I haven't tried it on a real
->antique, of course, but it does run on an old 486 running Win 3.11. That's
->as antique as I have running anymore.
->
->Gary
->Gary Coffman KE4ZV

I'm using it on a K6-233 under Win98. The problem seems to be that I also am running a good video card (Riva TNT) and I can't dumb the board down enough, even in generic VGA mode, to let the software recognize the video mode.

OTOH, I can't use anything slower with my other engineering programs without ordering dinner in between each command.

I asked ARRL about this, and got the standard "Yep, that's been a problem for a while" answer. And, I suspect, why there isn't a play-with demo, even major-crippled, to let us see if the software is usable on our systems.

From: kf5oj@prodigy.net
Message-ID: <37bf6e05.9539340@news.prodigy.net>
Source record: 67644

I'm looking for suggestions on what to use as a LO frequency source for a converter. I need LO output on either 500.0 mHz or 600.0 mHz with at least +7 DBM level.

I was looking for LO boards that have appeared in QST, Ham Radio, 73 or whever, where a board may be available and no exotic components required.

I thought DownEast Microwave might have something, but I haven't been able to contact them.

Any suggestions?

Clifton Turner KF5OJ

Have a look at clock oscillators for PCs. For a crystal freq of about 14 MHz, you can get a range of output frequencies. You may not get 500 MHz but a simple multiplier would solve that. Or try a PLL chip from one of the major makers, National, Motorola etc. and use a MiniCircuits VCO. These are only about 15 USD, have low noise and about a 2:1 tuning range and you can get them from 20 MHz up to 2 GHz.

> the surface. It is all surface transmitters to underwater ferrite rod aerials.

> I would suggest using ultrasonic audio, it propagates well under water and the
> transducers are many times more efficient than VLF tx aerials.

Yes, ultrasonics is a possibility, i'll look into that.

> Something around 60kHz would be a good bet for starters. Use transducers
> intended for depth gauges, the small ones are around 150kHz but some of the
> larger depth recorders work around 60k.

Can't use standard echo sounder transducers as they could interfere
with the vessels sounders.
The vesels use 50, 75, 120 & 200 Khz. Sometimes 28Khz too, therefore
the system would have to stay clear of these frequencies.

2103. Re: Radio HELP!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-22 00:00:00 UTC
From: nathan-and-staci@worldnet.att.net
Message-ID: <37c02eec.96763418@netnews.worldnet.att.net>
Source record: 67653

Thanks very much to both of you for the very informative posts. And yes the LCD did crack in shipment. But not because of the USPS, but rather the moron who packed it with the LCD pressed up against an edge of the desktop recharger. Thankfully the parts are cheap. I will try like the dickens to figure out how to get the unit back together and to do so in a way that the contacts are actually in the correct spot on the zebrastrips and the lcd panel. This may be difficult because there were no additional components to hold the lcd panel in place, so you can see my confusion.

Once again, many thanks.

Nate

2104. FS:QST Back Issues $1.00ea.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-22 00:00:00 UTC
From: Andrew <xandrew@tropicom.net>
Message-ID: <37C0340A.80BCADB3@tropicom.net>
Source record: 67654
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.space

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling 1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped) for 1 to 10 issues. If you are interested in over 10 issues or the entire collection, make me an offer. I am willing to ship anywhere on this planet so long as you are willing to pay the actual shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Dec $1.00 ea.
1994 Jan - Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea.
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.

Does anyone know of a shareware/freeware filter calculation program ?

Alternately, you have access to Eagleware or a similar filter
calculation program
and wouldn't mind...I need the the values for a 5th order elliptical low
pass filter for a DDS signal generator project.

Here's what I need...

Low pass Fc = 42 MHz.
50 ohm impedance in and out
Ripple <1 db
Components optimized to real parts values
I'd also like to know what the attenuation is at 80 MHz.

Please reply by email.
Thanks de Hugh VA3TO

For Sale,

28 VDC at 50 amp ccs power supply. From GRC-122 Ratt Van. Excellent condition. 115 or 220 primary. Metered for DC volts and DC amps. Will take massive overloads and dynamotors are no problem. I run my 618T(3) and and my ARC-2 at the same time on the unit without a problem. About 16 Inches cube and will just make the UPS weight limit versapacked, figure 145 lbs.

With schematics. $175 plus UPS from 95827. Or $160 if you pick it up at my QTH in Sacramento. I will pay for Versapacking if by UPS.

tnx for the read

>

Hmmmm....why are you using a ferrite core? Do you have any idea what
it's characteristics are? This thing appears to have *high* loss. I
think we just found where most of your power is going ;-) I would
recommend an air core coil. The tank should be able to resonate near
the operating freq, so if you have a grid dip meter you could try this.
I would suggest as a first cut, a coil 3" in diameter, wound with
something like 20 gauge buss wire. Put on as many turns as will fit in
your available lenght, and solder a short clip lead to one end of the
coil to allow changing the inductance.

Then you could try tunning the rig with some or all of the L in
circuit. Made in this form, the coil will have low loss.

>BE CAREFUL< DON'T CHANGE TAP ON COIL WITH B+ APPLIED!!! BE SAFE,
TURN OFF, AND DISCHARGE CAPS!!! IF IN DOUBT...DON'T DO IT!!

(The above is to keep the lawyers at bay)

Let us know how you come out :)

Alternatively, you could program a PIC 16C58 with the Parallax PIC16Cxx programmer which inserts a copy of the Basic Stamp interpreter (as well as your Basic code) and allows a $5 implementation of a Basic Stamp. Of course, you'd need to develop and debug your code on a Basic Stamp before you permanently burned it into a PIC, but only the $4 chip would be expendable.

An even better solution is to use the Atmel AVR AT90S1200 which has 1K on-board FLASH program memory & 64 bytes EEPROM, as well as the usual timers and stuff. Or, if you want to actually do distance/bearing/speed calculations and waypoints, as well as an NMEA conversion, the AT90S8515 has 8K of FLASH program space, 1/2K EEPROM, 1/2K SRAM, a UART, a hardware SPI, counters, etc. all on-chip. Not to mention that the Atmel AVR series has a much cleaner programming model than the PICs (which translates to faster development and less debugging). The development system is under $50. I've already ordered my GPS units and have started on the code. In fact, so far the biggest hassle is that the neanderthals at NMEA want to charge for their standards documentation instead of putting it on the web as a PDF file. I guess when you have a monopoly you don't have to encourage people to use your standard.

Message-ID: <37C1E821.CA0B7301@ica.net>
Source record: 67593

I have a "Julieboard" DDS board from a 73' construction article a few
years
ago. It is programmed from your PC or can be used standalone by using
thumbwheel switches and a micro as described in a followup 73' article.
The board produces a sinewave output up to 12 MHz. in <1 Hz. steps.
It uses the Harris 45102 28 pin DIP DDS.
I'd like to get $22 for it.
Anyone interested ?

What about using the unit's existing transducers to send the
data? If they can hear each other, but not the surface,
they could pass a token to tell each one when to transmit.

A goofy suggestion: if the data is all one way, what about
dumping it to serial eeprom, and floating it up to the
surface once in a while?

If it's real time, and you need a high data rate, I think you're going to need a cable. That seems to be the way all the mini robot subs are run. I also seem to remember that the underwater sonar stations the US navy had/has were connected with undersea cable.

> Thanks de Hugh VA3TO

Hi Hugh,
You did not state the minimum allowable attenuation, so I selected
-30dB.
First shunt cap=128pF
1st Parallel L-C in a series leg= 45.7pF/145.6nH
2nd shunt cap=135pF
2nd Parallel L-C in a series leg= 156pF/73.8nH
3rd shunt cap=83.7 pF

finite zeroes at 46.92MHz and 61.7MHz

I'm leaving on a short vacation in the AM, let me know if you need more
data or wish to shift the zeroes.
Filter calc. w/ Eagleware Genysis + Filter module.

This almost certainly could be made to work. However, doesn't a Basic
Stamp cost many times as much as the GPS receiver in question? That
makes the whole project somewhat less interesting.

If you're willing to program in assembler, you should be able to do
the job with a PIC or similar microcontroller much more cheaply.

The message <37d57242.136755026@news.dial.pipex.com>
from maad65@dial.pipex.com (Nick) contains these words:

> Do all of these have to run at the time you are working??

We need each sensor to fire data at about once per second.

> There is the possibility of making the remote electronics passive until it is
> polled by the surface unit.

> If data is embedded on each ping from the surface with a serial number then just
> the addressed remote unit would reply. The whole thing can then run on one
> frequency.

Yes that is a possibility i will look into. So long as we can poll
each unit about once per second, that should give each unit around
100mS to respond, the receiver to receive the signal and decode it,
then trigger the next sensor unit.

> 150kHz has transducers manufactured for it, that may be a possibility.

> You should be able to close a depth sounder Tx amplifier to give you the couple
> of hundred volts needed to drive the transducer.

I've not come across 150Khz transducers, i will look into that. We've
some of the old, 'cheap-n-cheerful' echo sounder units in that have
been scrapped. It should be fairly simple to change the signal
generation / amplification side to such a frequency.

> What are you actually doing if it is not classified or commercially sensitive.??

It is commercially sensitive ~ very! Sorry i cannot give more info
just yet, but i will say that should the prototype work o.k then
there are going to be some very sad Marine Electronics companies out there :-)
The unit will retail around 1/2 to 2/3 the price of existing systems.

> You may find RF from the surface into ferrite rod aerials on the under sea units
> interrogating them to respond with ultrasonics one at a time would work.

Whatever system is used, it requires to be fairly small (smaller than
a child's shoebox).

> Good luck

Thanks, we'll need it..

The message <37c6b000.56589611@news.squonk.net>
from noone@nowhere.com (KC2FCR) contains these words:

> A goofy suggestion: if the data is all one way, what about
> dumping it to serial eeprom, and floating it up to the
> surface once in a while?

I'm afraid it's not an option. It must be a cable-less data link.

> If it's real time, and you need a high data rate, I think
> you're going to need a cable. That seems to be the way all
> the mini robot subs are run. I also seem to remember that
> the underwater sonar stations the US navy had/has were
> connected with undersea cable.

I cannot say what the unit is for, but it's not a mini-sub or
anything remotely like it. Cable simply isn't an option. It MUST be
an ultrasonic or radio link.

We have looked at the specs again and if using a polling technique,
the data output can be cut down to:-

One Byte for Sensor I.D
Two Bytes for Data 1
One Byte for data 2

Total Four Bytes.
Using 8,N,1 that would be 10.5 bits per byte (including stop bit).
10.5 x 4 = 42 bits.
Maximum number of sensors is 10 = 420 bits of information.
Including processing overhead for tx/rx unit on vessel and also
taking into consideration the speed of sound through water (if thats
the way we go), it may be possible to get away with 1200 baud link.

Thanks All

Steve H

>72
>
>Bob 'POQ

For HF RF/IF amps: 6CB6, 6AU6 were both excellent in their time and there should be tons of them available new or used.

For low-level audio: 12AU7, 12AT7 and 12AX7. These tubes are essentially the same except for the amplification factor.

For audio output: 6V6 for medium power, 6L6 for more. Both of these come with various suffixes denoting whether glass or metal and what shape.

For rectifier: 5Y3 for medium power or 5U4 for high. Again, both come in various suffixes.

Thanks for jogging the memory cells... have fun!!

Bill, W7TI

Did you really calculate the polling sequence for this ?

The speed of sound is about 1500 m/s in water, a typical half duplex request/response cycle will thus take about 1 s, so you may have some problems scanning 10 devices within a second. You could of course transmit a single request and put a variable amount of delay, before the sensor responds, thus, the responses would arrive sequentially at the receiver station. This only works, if the sensors are fixed relative to each other and the central station. A sequence of pulses may also generate echoes that might cause false triggering of the sensors.

How large is the bandwidth of the transducers, would it be possible to allocate a slightly different transmission frequency for each sensor (say every 100 Hz) and let the sensors transmit continuously at a very low data rate.

Or how about a spread spectrum transmissions on the same centre frequency with different spreading code, this might help reduce echoes from ships, fish or from the bottom.

Sorry, i'm thinking 'ultrasonics is the way to go' but still thinking
'radio' in some calculations and totally confusing myself!
I'll immediately go out and give myself 10 lashes ;-)

I would love to be able to talk to each sensor individually, but as
you (correctly) pointed out, the propogation of sound in water is
going to limit the speed of polling and receiving info from each unit.
Maybe radio is the way to go and poll each unit individually, or we
may be forced to poll a master unit via ultrasonics and have each
sensor (which is between 2 and 15 metres away) talk to the master
unit via wires or low power radio links.
I think we are going to have sit down and have a good re-think about this.

My limited understanding is that it is modeled by saying
that there are two classes of electrons: superconducting
(those that move without dissipation) and ordinary (those
that move with dissipation). At dc, only the first class
are moving, but with ac, dB/dt pushes the other
class into motion also.

2135. Antenna help...

From: john_mason@mohawkind.COM
Message-ID: <003001beed72$825955e0$1332140a@Mohawk>
Source record: 67676

I have recently come into posession of some 50'-100' lengths of cat 5 twisted pair (4 pairs) cable and would like to use a piece to setup an antenna for QRP operation. I've been thinking about running a length from the apex of the roof to a tree about 75'-100' away (the only sizable tree on the lot). I figure I could use the wire as an end fed antenna with another lead to an 8' grounding rod.

My question is should I bother removing "one" wire from the cable and using it or just solder all 8 wires together at each end and feed the whole cable. The cable appears to be unshielded (no foil) and has CAT 5 printed on the jacket (which is blue).

Thanks in advance,
John... K4JJM

Nope. Sorry to say I don't have the facilities to do thoughs thing. I think I may have isolated the problem though.

First off I miss calculated the frequency, it is indeed oscillating at the correct frequency (I miss counted the hash marks of my scope). I got my watt meter and dummy load on friday evening and hooking them up and tuning to maximum output gets me about 10-15 watts (should be about 50 watts).

The final stage after the 1625 has some inductors that lead into a variable air cap-coil inductor-variable air cap pi network. The first air cap is a 140pF used for tuneing the final and the second air cap is used for loading. The coil is a hand wound 16 1/2 turn 16 tpi #24 3/4 inch diamature coil with a 2 inch piece of half inch diameter ferrite core. While tune last night I would hold the key for maybe 10-15 seconds at a time. After tuning and checking plate and grid currents for about 20 minutes I heard a dull "thunk" I look at the coil and saw that the ferrite core had melted though its plastic container. After applying the "wet finger test" I found that the core was boiling hot. Maybe 400 or 500 degrees F. It seems too much RF is being wasted in the final tuning coil. While tuning with the tuning cap I really never see a resonet "dip".

Based on what I'm seeing and my limited knowledge on the subject I think I need to ajust the number of windings on the coil. Is this a reasonable assumption?

No. Shorter wavelength equals more photon energy: E = hc/[lambda]. It's
not funny enough (quite) to be still funny even if wrong.

>have you priced an external GPS antenna at all??

Yes, one could buy the thing, discard the GPS receiver, keep the antenna, and it would be a good deal - for someone who needs an antenna. No argument.

But I thought we were talking about whether this would make a good GPS receiver, not just an antenna! So: if you write your own software and can interpret the data coming from the GPS directly, $20 for a receiver and antenna is an extremely good value. If you can program a PIC to translate the data into NMEA, that adds maybe another $5 or $10 to the total cost - still a good value.

However, a Basic Stamp is quite an expensive little beast, and makes the whole project several times as expensive if you use one. That may no longer be a good value, compared to brand-new GPS receiver boards that output NMEA directly. That's all I was trying to point out.

Dave

If you can contact the manufacture of the transformers you plan to use, they
should
be able to supply you with the "Hy-Pot" rating for them. In the USA it is
common to
find these "Hy-Pot" spec's to be 2500Vrms for 1 minute, primary to secondary
for
machine control applications.

Yep, 50 watts is about right

>variable air cap-coil inductor-variable air cap pi network.

The little inductor that is 7 turns of #20 wound on a 47 ohm 1 watt carbon resistor that has one end on the 1625 plate cap is a parasitic suppressor. The other inductor is the plate RF choke - book calls for a National R-100U, 2.5 mH at 125 mA. Both can cause all sorts of trouble if they are not the right component for the job.

> The first air cap
>is a
>140pF used for tuneing the final and the second air cap is used for loading.

Yep. A Hammarlund HF-140 and a 3 section BC capacitor. There are also fixed capacitors that are connected into the circuit on the 3.5 MHz band because the air caps alone aren't big enough to do the job on 80. 100 pF on the plate side and 470 pF on the loading. Note that these should be mica, not ceramic, and rated at least 1000 volts.

>The

>the tuning cap I really never see a resonet "dip".

There's at least part of the problem - the core is not meant for that sort of use. They used a Lafayette BC loopstick core - characterisitics unknown. The dip with no load on the rig should be really deep and sharp.

For the core to get hot enough to melt plastic in just 10-15 seconds, it must be dissipating a couple dozen watts of RF!
>
>Based on what I'm seeing and my limited knowledge on the subject I think I
>need to
>ajust the number of windings on the coil. Is this a reasonable assumption?
>
You need to either try a different ferrite rod material, or use a coil that does not use a ferrite core at all. I'd recommend the latter.

The coils originally specified in this rig are made from B&W Miniductor mounted inside molded polystyrene coil forms. These were once a common item but are now quite rare. The plate coils used are somewhat small for the RF power level - I'd use something on the order of 1-1/4 to 1-1/2 inches in diameter, wound with at least #18 wire.

What size should the plate coil be? That's a question easily answered by flipping to page 157 of the 1967 Handbook and using the charts.

First step is to determine the output impedance of the 1625. This is determined by the ratio of plate current to plate voltage. This rig operates the 1625 at 680 plate volts and 110 ma, so the ratio is about 6. From the charts, and using a loaded Q of 15, the plate tuning capacitor should have about 200 ohms reactance, the coil about 225 ohms reactance, and the loading capacitor about 30 ohms reactance. We'll do the whole drill to demonstrate the process.

Next we have to figure the inductance and capacitance values that correspond to the above values. There is no reason to go beyond about three significant figures in these calculations, because the components are just not that precise. There is also the factor of stray inductance and capacitance, and the output capacitance of the tube..

Capacitive reactance is given by the formula

Xc = 1/(2*pi*f*C)

Rearranging for C, we get:

C = 1/(2*pi*f*Xc)

or, more simply,

C = 1/(6.28*f*Xc)

This formula works, but it requires the frequency in Hz and gives the answer in farads.

So for a reactance of 200 ohms at 3.7 MHz, we get

C = 1/(6.28*3,700,000*200) = .000000000215 F = 215 pF

However, we can rewrite the equation to use MHz and pF. It works out to be:

C = 159,000/(F*Xc)

so

C = 159,000/(3.7*200) = 215 pF

which gives 215 pF directly. This is the total capacitance needed for the plate tuning. The 1625 has an output capacitance of 7 pF, and stray capacitances will amount to at least 3 pF. That leaves 205 pF to be supplied by the 140 pF tuning capacitor and the 100 pF mica padder.

For the loading capacitor, we use 30 ohms for Xc and get:

C = 159,000/(3.7*30) = 1432 pF.

These are within the range of the capacitors used.

Now for the inductor. The formula for inductive reactance is:

XL = 2*pi*f*L

Rearranging for L, we get:

L = XL/(2*pi*f)

or, more simply,

L = XL/(6.28*f)

This formula works, but it requires the frequency in Hz and gives the answer in henries.

So for a reactance of 225 ohms at 3.7 MHz, we get

L = 225/(6.28*3,700,000) = .00000967 H = 9.67 uH

However, we can rewrite the equation to use MHz and uH. It works out to be:

L = (.159*XL)/F

so

L = (.159*225)/3.7 = 9.67 uH

If you've followed this far, you can see that with the charts and some simple math, we can design pinets for almost any frequency and tube output impedance.

Finally, we need to figure out how to wind a (#!%&/!) 9.67 uH coil. This is the toughest part, because there are many variables. One formula for inductance of a single layer solenoid aircore coil is:

L = (a*a*n*n)/([9*a]+[10*b])

where a = coil radius, b = coil length, n = number of turns, and L is in uH.

Let's say we use a 1-1/2 inch coil form and a winding 2 inches long. Looking at the above formula, we find that

(a*a)/([9*a]+[10*b]) is a constant. Plugging in .75 for a and 2 for b, we get a constant of .021

That is, L = n*n*.021 for a 1-1/2 inch diameter coil 2 inches long. Using 21 turns, we get L = 9.26 uH, which is pretty close. It's better to be a little low than a little high, because there will be stray inductance in the wiring.

You can rearrange the equation to solve directly for n and get:

n = Square root of [L*([9*a] + [10*b])]/(a*a)

which looks pretty awful, mainly because I'm trying to express math formulas without using too many symbols.

Any questions so far?

A word about tuneup: This rig has a 3 position "cal - op - tune" switch. You tune it up by first setting the grid current in the "tune" position, then switching to "op", closing the key, and doing the "dip the plate, adjust the load, dip the plate" sequence. Some pointers on this game:

1) Don't hold the key closed any more than 10-15 seconds during tuneup. Once you get the hang of it, tuning up takes a few seconds at most.

2) Go back and recheck the grid current after tuning up the plate circuit. The grid current is often affected by plate tuning.

3) The last adjustment should always be dipping the plate.

4) Log the settings of the various controls once you determine them. Makes retuning really easy.

5) Watch the plate and grid current meters, not the output. You may be tempted to tune for maximum output, and you may get more than by following the tuning sequence in the book. But that's because you will be running the tube beyond its ratings.

>bulb for the dummy antenna. After tuning around a bit I found that I
>could get the light bulb to light, but very dimmly. I guess that I had
>always assumed that the light should be very brite, is something amiss?

Sounds like it. That power supply should produce almost 700 volts on the 1625
plate under load. With 3.5 mils of grid current an 100 mils of plate current, a
properly opeerating Class C 1625 will produce more than enough RF to light a 40
watter to full brilliance.

>I think I have two probelms but they are probaly from the same error.
>First, the voltage output may be alright but maybe I'm not getting
>enough current? Second, how am I pulling a 3.710MHz crystal to 4.44MHz?
>Any help would be great.

There are several possibilities:

1) Power supply troubles, such as too low plate or screen voltage
2) Mistuning
3) Problems in the tuned circuits
4) Bad tube or other component.

More to come!

That's NEVER EVER EVER happened to me. Honest. :-)

> It seems too much RF is being wasted in the final tuning coil. While tuning with
> the tuning cap I really never see a resonet "dip".

In view of the excellent tips others have already posted, let me add only
that it might be a learning experience to run the final tuning circuit
(presumably a pi network) through Spice and look at what's happening in
that coil.

If the coil is the right value (and I have my doubts based on the quote
I left above) *under the actual working conditions of the circuit*, then
most likely you're not wasting too much RF there. Just remember that a
1 mH coil isn't always a 1 mH coil under all operating conditions. :-)
For example, a saturated core changes things. Or you might wind uninsulated
wire tightly at 25 degrees C, then run the coil in -40 degrees and have
the dimensional changes be enough to short turns. Or... well, imagination
is never as rich as experience. :-)

If you can support it then use all 8 wires. Lower losses due to the increased surface area and all that stuff. One thing you could do is to cut them to slightly different lengths which will have the effect of increasing the bandwidth if used as a resonant dipole.

I am looking for a schmatic for a RX Noise bridge. I perfer with R and C/L, similar to the Palomer(?). Can be solid state or tube. I will pay for shipping and copying. Please include a parts list, if necessary. Since some may do this for free, please contact me first before doing anything. Many thanks.

Bob OM,

Many have been built; popular design. I have a copy of the GE Ham
News Nov-Dec 1959 article featuring a GG pair of 813's. I built and
used this amp for many years, when I was handling NTS CW traffic. It is
probably one of the simpler designs you can build.
If you are interested in a copy, just send me an E-Mail at
W6JL@ixpres.com, and I will be happy to send you a copy. Be advised
there are many others that have been built, including a later version of
this particular amp.

73,

We currently use the PICSTART programmer for the PIC's, but we are
willing to give the AVR a shot (the PIC's are too limited IMOH).
Is the ICE windows based? I've seen some of the cheaper ICE's for
PIC's that are DOS based (YUK!).

Windows, a very nice job. You can pick up the SW from their web site,
www.atmel.com The AVR assembler, Studio (the simulator and ice) are both
free downloads. The Ice looks just like the simulator.

Jon,

In a word: "no".

The capacitors are marked with a "Working Voltage DC", a value somewhat lower than the 12V max surge voltage (probably 10V in this case). A good rule of thumb for conservative operation and long component life is to derate the capacitor to no more than about 80 percent of its WVDC. In this case, you shouldn't exceed (except very briefly) 8 VDC on those particular capacitors.

And depending where you're connected (e.g. ahead of a regulator or dropping resistor), the actual voltage you're applying in your "13.8 volt power supply system" may greatly exceed 13.8V.

You probably want a 25 WVDC capacitor for your application. If you're bound and determined to use those capacitors (hey, this is "amateur" radio, not "professional" radio :-), you could put a couple of 'em in series (equalizing resistors recommended).

73,
Joe "still having nightmares about my years as an H-P component engineer :-)" Dubner

Hi All,
thank you for reading this NON COMMERCIAL message.

I'm looking for info about TS 440 S like follows:

-mods and improvements you have personally experienced or heard about;

-troubleshooting or problems you managed to solve on your own.

All this info will help me to create a web page about ts-440s .
Please help me to make this site as complete as possible.

The site will be free access and the information will NOT be used for
commercial porpouses but only for electronic experimentation.

Please, if you have some info, just send me an e-mail to :
dcl@ascu.unian.it.
Just send me a short summary of what you experinced. I'll chech this info
and, if what you sent is something new, I'll beg you to send me the
complete description of your experince. This procedure avoids to have a
lot of articles dealing with the same matter.

Thank you and 73.

The $20.00 Electro Mavin GPS Project Came through the rollover without a problem, feedback from end users is that it didn't skip a beat, and is working just fine. For you who have picked up the unit, we have new info just posted to our web site with a Windows program and documentation to get the unit working in short order.

http://mavin.com/slickitems.html

I'm going to try to have one up and working this weekend at the TRW Swap Meet, check us out at spaces G-27

Thanks,
John Plemons

> >

Depends. Some transformers have enough insulation, some don't. Do a test with a high voltage "portable mains equipment " tester, modern ones will go to 4kV. It might be a problem in Ireland with it being so damp. Otherwise, get a 700V transformer. They are not so rare over here. Proper high power EHTs transformers giving 2-4kV are much harder to find.

If you wanted 2-3kV at 500VA, it is easy to do with microwave oven transformers. They cost very little new (30-60 pounds) and you can buy a complete oven new for 50 pounds to build the amp into.

>voltage doubler based around a bridge rectifier.
>
>
Unfortunately the performance of a transformer in a voltage doubler
circuit isn't simply about the power (VA) capability. DC output voltage
regulation from a doubler is very poor unless the secondary resistance
is extremely low - much lower than you'd find in an ordinary transformer
that has not specially designed for doubler service.

A lot of people have learned the hard way that if you require
significant output current and good voltage regulation, ordinary
transformers don't work well in voltage doubler circuits.

Somebody was looking for Nuvistors? I have 2- 6CW4's and 3- 6DS4's that were used a long time ago in some homebrewed 2M equipment, all working when last used.

I can't guarantee their condition now because I have no way of testing them, but if you're up to taking a chance, I'll ship all 5, plus 3 sockets, for $40.

Hello DR OM
I'm Roberto IK2RND , I have realized a replacement board for EX-314
MEMORY BOARD installed in these Icom rigs :
IC-745 IC-751 IC-751/A ICR-71A/E IC-271A/E IC-471A/E IC-1271.
My board called EPROM/RAMBOARD definitely solve the problem related
to the lithium battery fails. When battery fails the rig stop to work
and you need to send your radio or EX-314 board to the Icom service
center to replace battery and reprogram the memory.
Data in the my board are stored in an EPROM chip the RAM is used only
to store the 32 memory channels.

Bill,

I use a Statpower ProWatt 1500 for emergency power for the house. I also use a Statpower Portawatt 1000 for "portable" power. I had a Whistler 500, but it completely failed. I also have a Whistler 300, but it's too small for most applications. (Surge power demand for motors etc. can be very high). I highly recommend Statpower. The quality is better than some of the others (but the price seems to be higher also). Statpower definately includes RFI circuitry. My installation has NO RF interference using the Statpower units. However, the antennas are in the clear, separated by distance from the ac power, and fed with hardline which reduces RFI pick-up. I have noticed a little "buzz" on low cost AM broadcast radios plugged into the inverter's ac power.

I strongly suggest you contact http://www.skingco.com/ They carry several lines of power inverters and can make comparisons and recommendations. I think that they were also planning to do some comparison RFI testing.

2180. Re: HELP! Tube Guru's Advice Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-25 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <37C40F08.321A158F@midwestmicro-tek.com>
Source record: 67627

Thanks for the help Jim. You and Blake and the others have really help me get a handle on this stuff. So here is what happend last night.

I read the many measages posted and e-mailed to me on determining the proper size coil for the tuning coil (thanks guys!) and decided that I'd start out by wrapping about 30 coils of standard solid hookup wire around a 1 1/4 inch form and then unwrapping one coil at a time and re-tuning the rig. Oh by the way, before starting with the new coil, when tuning with the light bulb I showed @25 watts output but when tuning with the 50 ohm dummy load I showed about 5 watts out, much smaller resistance on the light bulb?

To start, I took out the old coil and put in the new one and started tuning. I unwrapped about 7 coils, each time I got a few more watts on the meter. I started with about 2-3 watts and by the time I got to 23 turns I was showing @25 watts. But here is the puzzler, I could use the tuning capacitor to tune the coil in and out of resonance but once I tuned it in, adjusting the *loading* capacitor made so changes. In affect the loading capacitor didn't seem to be influencing the pi circuit at all. I should think that it would at least cause the resonant circuit to go out of resonance, but it didn't. Anyway after reaching a peak of 25 watts I then started lossing ground as I unwound more coils. Then I hit another peak of about 20 watts when I reached 19 turns. The watts then again fell off and at 10 turns I stopped the experiment. I'm not sure but I'm guessing that the second peak was probably the 40m harmonic.

Okay, heres the kicker, besides the loading cap seeming to be ineffectual, at no time did I ever see the "resonant dip". Accourding to the tune up proccedure, to find the dip you set the mode switch to TUNE and set the meter switch to read plate current. (When I did this I saw about 5 mA on the meter is this reasonable?). Then, with the loading cap at full, you tune the tuning cap untill you see a dip on the meter, thus indicating resonance. I never *once* saw a dip. Not even when I got 25 watts out of the rig. And I got the same 5 mA reading whether the tuning coil was installed or not. At least with the old coil I saw a slight dip when the tuning cap reached it's mimimun setting.

An idea here, maybe that first peak was actually the 40m harmonic and the second was the 20m harmonic and I should try the same experiment but with say 40 coils to begin with. Is this a reasonable ussumption?

So I'm looking at three variables here.

1. Is the 5 mA plate current reasonable and should the coil being disconnected affect that reading? It would think it should.

2. Why is the loading coil not making any difference (checked the wiring
and it is sound).

3. Is the coil still too small?

I'm going to try the experiment with a larger coil tonight. I also have
a 40m crystal and I've built the 40m coils as well so I think I'll try
tuning with the 40m stuff as well.

Thanks for all the help!

Rick

I just replaced the lithium battery in my TS-440. This is a CR-2032 3 Volt coin cell and is available in horizontal PC mount configuration from Mouser electronics for $1.43. Actually what I did was to use the slightly larger CR-2450 (available from Wal Mart) and soldered in the matching button cell battery holder. This was a good match to the battery leads extending up out of the CONTROL ckt board. There is a metal shield covering the CONTROL board which allowed sufficient clearance for the CR-2450 and socket. But to be safe, I applied a couple strips of black tape to the shield to guard against accidental shorts to the battery.

The most time consuming portion of the project was simply to find the location of the battery. The service manual didn't address battery replacement. The instruction manual suggests having the battery replaced at a service center. However it did have an unidentified sketch of the battery on page 29 where it discusses installation of the IC-10 interface kit. The procedure to access the battery is given on the same page under 6-3-1. Installation, which explains how to open up the front panel. Replacement is fairly straight forward and afterwards, reset the CPU by pressing A=B along with the POWER ON switch. The rig should then power up on 14.000 MHz.

As a TS-440 owner, I'd be supportive of a site that documents problems and solutions. I do have the service manual but it's written on the assumption one has already attended a course in theory and repair :-(

I'am searching for constructiondetails and/or measures
from the Norcal Paddles or, even better, a not used set of the
brass parts. Homebrewing is easy when you can use machines
and not only a saw and file?
I already have enough JPEG/GIFF pictures!

Any info is welcome.

ILP, if they're still in existence and based in the UK, used to
manufacture "made to measure" transformers at what was quite a
reasonable cost.

Toroidal, with whatever ip/op you want. Compact, small and less likely
to breakdown than something that's been lying around for years.

Been running 3 of these in a voltage doubler with 4KV o/p at 1amp for
several years. Though I would agree that doublers/triplers are best
avoided.

2187. Re: HELP! Tube Guru's Advice Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-25 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.SOL.4.10.9908251841540.25349-100000@Ocean.CAM.ORG>
Source record: 67634

Here are a few things to keep in mind.

While it may seem more complicated, think of the output pi network (the coil, the tuning capacitor and the loading capacitor) as a simple LC parallel tuned circuit. It might be more obvious if you imagined putting a short across the loading capacitor. Then you'd just have the tuning capacitor in parallel with the coil. Vary the tuning capacitor and it will put the circuit in resonance at some point, provided you have a a coil of suitable value.

The loading capacitor is just a means of getting the RF out of the LC circuit, in such a way that it matches the antenna. Instructions for tuning pi networks say to set the loading capacitor to maximum. This in effect puts the capacitor as close to a short as it will come, since when two capacitors are in series (and the tuning and loading capacitors are in series, across the coil), the much higher value has less effect.

So you set the loading capacitor to maximum, and then deal with tuning the LC circuit to resonance. There should be a definite peak, and the peak should take place somewhere in the middle of the range of the variable capacitor. If resonance comes at minimum or maximum capacitance, the coil needs adjusting (more turns if the capacitance is at maximum, less turns if at mimimum). Otherwise, you can't be sure that you have reached actual resonance, or are simply close to it.

Once you have the tuned circuit to resonance, then you have to deal with getting power out of that tuned circuit and into the antenna. So you start adjusting the loading capacitor. And yes, as you decrease that loading capacitor, it will affect the resonance of the tuned circuit, since there will be less capacitance across the coil. So you will have to readjust the tuning capacitor. And that's why there will be a back forth between loading and tuning, because each time you adjust loading to get optimum power to the antenna, you have to go back and get the circuit back in resonance.

Light bulbs are not good dummy loads. They are not shielded, so your signal will radiate to some extent. They are not a standard impedance, so if you tune for brightest light, that doesn't mean the transmitter is set for optimum use with a 50 ohm antenna (or any antenna for that matter). And the resistance of the bulb will vary as it receives more power, adding another variable to the mix and creating more back and forth between the tuning controls.

Ligthbulbs were promoted back in the days when test equipment wasn't readily available, and presumably a lot of people building the equipment had little money. However, a lightbulb may be good for your purpose, because you are still trying to get the feel for the transmitter and a lightbulb may be easier to follow than a wattmeter for experimenting purposes.

I gather you have a wattmeter? If so, the reading will change if you switch from dummy load to lightbulb, since they won't be the same impedance and the wattmeter will not be reading right with the bulb.

The meter in the transmitter is used for three things, as Jim pointed out.

One position is to measure the voltage going to the oscillator and the final screen. That position will not be used much during operation of the transmitter. That switch position could be removed, since you could do the same with an external voltmeter to make sure that voltage is correct.

Another position is for measuring the grid current of the final. You need that to make sure the tube is getting enough drive from the oscillator. The instructions even say to put it into that position, and tune the plate of the oscillator, with C2 the 100pF variable. It says to tune for 2 to 4mA.

Something tells me you may have the switch in that position (assuming you built the transmitter exactly as shown, and wired it correctly), because of your comment about no dip and "5mA".

The third position for the meter is to measure the cathode current of the final amplifier. This is the one that's going to dip as you bring the output to resonance. That might be your problem of seein no dip.

Also, if you don't have the key pressed, this position will not show much reading, if any.

The more I think about it, the more I think the meter switch position might be your problem at this point. It sounds like when you wound a new coil, and as you removed turns, you did get a coil that resonated in the 80 meter band. 23 turns might be about right, since you are using a slightly smaller coil form than the original design called for (which was 19.5 turns on 1 1/2 inch form. And you did get maximum output at that point.

Try getting the switch in the right position, and see if that coil doesn't now dip.

If you think about that 5mA reading, if you multiply it by the plate voltage, it is extremely low input power to the amplifier. Say the plate voltage is 400 volts. 400 times 0.005A is 2 watts input, and output power will be less. That doesn't seem right. Even the instructions say the cathode current should be 90 to 100mA.

I wouldn't think so. I personally would not use anything less than 25 V
or preferably 35V. I had one of these go off in my face and it made a
lasting impression. No the metal stuff didn't hit me, but from where
the metal shrapnel(sp?) was found several people thought it went
interdimensional, because from all evidence it *should* have hit me.

Hope this helps.

Take care es 73, Vikki.

However - you could use two in series with balancing resistors to give you 80000 uF at 24V.
Remember you need something like 18V DC on the capacitors to give headroom for the regulator to work with.

2193. HF radio using MC1350 as IF amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-26 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7q3erq$e2c$1@uranium.btinternet.com>
Source record: 67493

I am considering making a simple homebrew HF radio using an MC1350 as the IF amplifier, with an IF of 1.6MHz. I do not have any suitable crystal or ceramic filters, but expect to get enough selectivity with the high IF and perhaps by preceding the MC1350 with a few transformer coupled stages of IF amplification. Does anyone have experience in using the MC1350, and what sort of performance should I expect from this setup.

Thanks, best wishes from David.

2194. Re: Do Power Inverters Make a Lot of RFI?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-26 00:00:00 UTC
From: "aaa@bbb.com" <aaa@bbb.com>
Message-ID: <37C546AC.9EC0DE@bbb.com>
Source record: 67494

Most of the Hi efficiency
invertors use 50 Khz RF or so like a
computer power supply to convert
12 volts to 120 volts AC 60 Hz.
The convert the 150 volts DC at the other end of the DC-DC
to 120 volts AC by chopping it up in a bridge.

Now, 50Khz can generate a lot of RFI, if not properly filtered.

Some of the older invertors using the huge IRON CORE transformer wont
generate so much RFI as they are only operating around 60 Hz.

It shouldnt be too difficult to build your own with a 10-12 volts -
120volts
20 AMp transformer and a few MTP3055 transistors driven off
a TL494 or LM3524 and running at 60 Hz.

Advantage of TL494 is to provide variable/adjustable duty cycle
just like the commercial invertors do to provide quasi-sine wave as they
call it.

hi there,

6u8 = mixer, rf amp , oscilator, audio preamp, audio lineamp, headphone amp, audio phase invertor.

6ba6 = if amp, rf amp, oscilator (vfo or crystal)

6bq5 or 6l6GC or 6kg6 = speaker driver, or FInal for (QRP) transmitter

This is the least I need to get going .

12au7 for audio
and
6ak5 for RF and audio

is what I will consider also

Dont forget the 6EH7/6eJ7 frame grid pentodes with GM = 12-15 mS.

Let me know how it goes

Three yrs ago I got a new battery pack for a TR2500 (without any old battery casing) from East Coast Transister Parts, Inc., 2 Marlborough Rd., West Hempstead, NY 11552 phone at that time was: 516-483-5742

It cost $75 at that time.

I don't know the construction/part number for the tone board but my TR2500 uses a TU-1 which is a module that goes on at the bottom of the radio and the battery goes on after the tone module. I have not been able to find one out there and have seen a few other requests of the past three yrs.

You won't get narrow bandwidth at that frequency with just IF
transformers.

A single tuned circuit sets the bandwidth, and it will be too broad at
that frequency.

Additional tuned circuits will not narrow the bandwidth, only improve the
skirt selectivity.

What you will end up with is the equivalent of a direct conversion
receiver, with a converter and IF amplifier ahead of it.

That's not completely bad. You'll get a feel for superhets. And if you
plan it right, you could add a filter later.

Consider putting the IF on a frequency where you can get crystals, and
then build a simple ladder filter for it. Even a simple crystal filter
will give better results than some tuned circuits.

Filters aside, I think it's easier to build a receiver nowadays with a
high IF than a 455KHz IF. You don't have to worry about tracking the
front end with the local oscillator to keep images out. You can have the
front end tuned separately from the oscillator, and not worry that you are
tuning to the wrong image. You also will not need as many front end tuned
circuits for the same amount of image rejection.

The MC1350P has to be fairly straightforward to use at this point,
considering it's about thirty years old now. Use it with a good ground,
and bypass it well. The pinout is such that you can put a ground across
the device to separate the input from the output. It has lots of gain,
and is good up to the 45MHz range (where television IF's are, and for
which the MC1350P was aimed for).

Consider building it "dead-bug" fashion. Just take a piece of copper
circuit board, use that as a really good ground point, and build

the circuit over that. I was doing that before the term was ever used in print. The big ground surface will help you keep things from oscillating. The method allows for easy changing, at least compared to a printed circuit board.

If you build the receiver in module form, then you can change things later if things don't work out so well. Put the front end and mixer on one board. Then the IF separately. Might even be smart to put the product detector and BFO separately, and perhaps in a shielded box. (I've made boxes out of circuit board stock, though they tend to be a tad uneven. You can also pull out some nice shielded boxes out of TV sets and VCRs.) Then you can change the IF circuitry or move it to another frequency without having to rework everything.

Excellent point, Roy.

If it's an option, it would also help to put some filtering after the
MC1350 prior to detection. I homebrewed a QRP rig a few years ago with
4 poles of xtal ladder filter before the MC1350 and 2 poles after it.
It made for a very "quiet" receiver with very little background hiss.

Hi all,

I'm sure we've all mounted an LED or two into the case of a project box,
but haven't they all been circular LEDs ?
I need to fit 43 LEDs into a project case in a circular pattern but I'd
like to use the rectangular LEDs (5mm X 2mm). For the regular circular
ones you just drill a hole with the right size drill bit but has anybody
any ideas on how to make neat rectangular holes.

Yeah, so?

I guess I'm not getting the joke. Of course you
could set up a field of antennas and power your
equipment from it. The trouble is, a regular antenna
only develops a few microwatts. You would be much
farther ahead just to put in photocells.

BTW, Sandia National Labs developed an antenna for
IR about a decade ago. If they succeed in producing
an antenna for visible or UV, it should open the door
to greatly improved solar cells.

There are groups in the United States who protest
high voltage lines, and just to dramatize their protest,
they carry standard shop fluorescent tubes and stand
under high voltage lines. I remember the picture in
"Reader's Digest" showing a group of a dozen people or
so, arms held up in the air and holding 3-foot fluorescent
tubes that glowed eerily from the induced voltage of
the lines 100 feet above them. This is an interesting
visual effect after dusk.

Perhaps someone may know more about this and can elaborate.

I heard a story 20+ years ago of someone living very near to the BBC Droitwich Longwave transmitter (198kHz) doing exactly this having constructed a loop in the attic of his house.

The transmitter runs either 500KW or 1MW and can be received over all of the UK and most of Europe.

The BBC couldn't understand why there was a distinct null in their radiation pattern, and this lead to the offender being tracked down.

He was proscuted for the theft of electricity.

So, to summarize, you are claiming that someone built a loop antenna in their attic that was able to collect a noticeable amount of energy from a transmitted waveform that has a 1500 meter wavelength. You are further claiming that the amount of energy collected was so significant that they noticed a "distinct null " in their radiation pattern. Right. Can you say, "Urban Legend"?

About everyone that gets involved with electronics dreams up plans of stealing power from the power company or the local AM station. What they don't realize yet are little things like wavelength considerations and the fact that you can't collect more energy than is passing through the antenna's induction area - and that R^2 term kills you, even in close. Even if the antenna was next door you would have a hard time getting even 0.1% of the radiated energy through your attic. So you are already down to less than 500W. And then your efficiency of recovering it would be atrociously low - and even at 10% you wouldn't have enough energy recovered to light a decent light bulb.

Sounds appocryphal, since tapping the far-field is just what
everybody with a radio does (no effect on the transmitter), and ther is
certainly no screening of receivers downfield with a little antenna
like that. Tapping the nearfield would not have an effect on EMR
pattern-- at least not the kind the BBC cares about. It would show up
as an unexplained transmitter-antenna impedence mismatch, and overall
power draw, but I refuse to believe this would be noticed, unless
somebody did some serious winding of coils around the antenna itself.

So then every body with a radio or tv could, less electricity, sure, but still
some.
I read someone in the US stole a bread (from a church), because he was hungry
(probably had diffficulty finding a job, it was his second conviction).
Then he got LIFE for that (yes 1999).
Justice is still only for the rich is it not? The English judges send people to
Australia in labour camps for steeling food.
Well, I would not mind living there now, beautiful place.
But from this you can learn, better 'detune' your radio, or you may get the
chair.

I have both ARRL Radio Designer and the latest version of EWB, called MultiSim 6.0.

MultiSim, Personal Edition, sells for $400. I like it very much for DC, nonlinear and transient analysis, using 8 kinds of Virtual Instruments. The Prodessional Edition, with expanded features (I would like to have it), sells for $900.

Radio Designer sells for $150 and is far superrior for RF linear design, in my opinion. Its Circles Utility is an electronic Smith Chart that is excellent. Its Optimizer Utility and Probe Utility are also excellent.

I have used Radio Designer since it first came out, on several different kinds of computer, with absolutely no problems of any kind. But it is possible that collisions can occur between different applications in a computer. I have seen some of this, but not with Radio Designer. Most of the time a PC-knowledgeable person can track these problems down in a particular PC and fix them. Incorrect or conflicting Registry Entries are often the culprits. Dynamic Link Libraries sometimes conflict.

I really think that the badmouthing of Radio Designer from certain quarters is mostly hogwash.

A milling machine and rotary table, plus some files for touching up the corners.
The rotary table can precisely align the holes in a circular pattern.

Expensive, but perhaps worthwhile if you need this sort of stuff every week or two.

Alternately, the low budget method is to drill small holes and enlarge them with
a file. I've actually done this with 1/16 (1.6mm) holes in copper and brass for
10 GHz slot antennas--it would be much easier with aluminum.

It is possible using a mill (almost rectangular) or by using a punch and die. With effort, a small file. With the prospect of 43 of them, all at the correct relative angle to the circle, I would convince myself that round LEDs were "artistically correct".

Well, note that the transmitter mentioned here broadcasts at quite a long wavelength, about 1.5 km. So the near field extends rather far and if the house in the story was within few hundred metres of the transmitter (quite possible), it was deep in the near field.

DIA

2221. Re: HF radio using MC1350 as IF amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-27 00:00:00 UTC
From: N6BIU <spam@nospam.com>
Message-ID: <7q6k5f$4r7@dfw-ixnews15.ix.netcom.com>
Source record: 67521

Using a ladder filter with the MC1350 is probably the best approach for selectivity Vs cost.

I wrote a spur analysis program some years ago and when I ran it looking for a good IF frequency relative to 40 meters, I was pleased (and surprised) to learn that 5.000 MHz crystals and a (Approximately) 2.15 MHz VFO are among the better choices. You'd be amazed at how many of the choices for the IF frequency have potentual spur problems.....

This allows using common (and CHEAP) 5.000 MHz crystals, and the VFO frequency is low enough that I used a varactor diode for the tuning. While the transciever is not complete yet, the Rx is up and running. I cheated a bit on the Rx and made use of a VERY obsolete part (LM373).

If you look in the "QRP POWER" published by ARRL, you will find a similar system designed by KH6CP although he used 12.000 MHz crystals. His design does use MC1350 chips and he optimized for strong signal ability. I'd recommend reading his article in detail, it has a lot of good design information.

I do a small radio restoration column for a "popular" non-ham
SWL/Scanner orientated magazine. After offering some simple projects, I've
noticed a fantastic response from the readers; but, I am slowly
realizing that the median age of most people I hear from falls
between 65 and 72! It's interesting when you receive long, handwritten
letters
from Old-Timers, but never even an email from someone younger showing an
interest in the old technologies or proper restoration techniques.....

I am wondering if anyone under the age of 50 is building radios anymore, or
is the "magic" of building a one-tube regenerative receiver using a 30 or
'99
tube reserved just for those of us with AARP membership. I am feeling
kind of sad, because more than a few old timers have sent me the
remains of their junkboxes because no one else is interested; and they
didn't
have the heart to take the stuff to the dump. (Nothing special, old sockets,
resistors, coils, etc.)

I am wondering, are we really the

Yep. It remains to guess at the current in a transmitter antenna in
such a setup, figure out the magnetic flux at (say) 500 m, and then
what power you could expect to generate with an antenna loop of a given

area, ala Faraday. For this purpose it doesn't matter if the loop is one wire or a thousand-- same power out, just different voltage.

My dad, who's 79, got a computer last year. I never could get him interested in ham radio, but he's taken to NetMeeting like the proverbial duck to water. He doesn't keep track of the countries he's talked to but I know he's well on his way to 100. He learned Morse in the service but never liked it, and I sure wouldn't let him listen to some of the going's on on the HF ham bands. He talks to a lot of young people, who seem to appreciate his mature opinions. I doubt they could carry on the same level of conversation on the ham bands--for one thing, NetMeeting is full duplex, and he has a camera, too.

I got interested in ham radio because of a neighbor we had when I was 10 or 11. He took me and his son, my age, to Field Day one year. There was all this old surplus stuff with mysterious dials and knobs. Even the commercial stuff looked neat. You could tell a Hallicrafters from a Hammarlund at 100 feet (well, in those days I could!). The R8 I have now blends in perfectly with all the audio gear in the cabinet, and you can't tell a Yaesu from an Icom from a Kenwood unless you walk right up to it. Digital readout and computer control means you can pop right on to a frequency--no skill involved at all. Computer games and hacking seem to be the challenges now. Building radios that will never compare with even cheap commercial stuff just isn't attractive. Way back when, commercial gear was priced out of reach of many of us, and even if it weren't you could still match the performance with homemade stuff if you worked at it. I got my start fixing 25-cent console radios obtained from the Salvation Army, and tearing apart discarded TVs. That avenue of progression is nearly closed now.

Yes, I think we are dinosaurs!

73,

Jim

> d.l.c@btinternet.com please.

I doubt it ... the spec'd maximum operating frequency of the VCO is
500 kHz.
If memory serves me correctly ... I didn't read the entire data sheet
... it's
an R-C multivibrator type of VCO ... TOTALLY unsuitable for RF usage.

There are lots of PLL chips available from National, Motorola,
Fujitsu,
and many others ... check their web sites and you'll find something
that
will be useful.

If you want to make something that covers 1-30 MHz, there are a
number of things to consider ... first, you're unlikely to build a
good
VCO that can cover that range. That implies either bandswitched
VCOs or running a VCO up in the VHF/UHF range to get the
tuning range and then dividing down.

Depending on your application a DDS may be a better choice.
There you can easily get coverage of the entire band with a
single chip that's controllable via a microcontroller or via a
simple interface from a PC printer port.

I hope this helps some and stimulates some thought.

Would that really surprise you? After all, building a one-tube
regenerative receiver is merely a regurgitation of something that
was done hundreds or thousands of times back in the 30s ...
and the result will be a vastly inferior receiver to what one
could easily build with as few as one, to perhaps a few,
modern ICs ... and it would likely radiate like crazy.

I don't find any "magic" in that ...

I can't for the life of me understand why anyone would
be attracted to waste the time in such an endeavour when
there are so many more useful, more interesting things
well within reach.

With all due repect, it would seem so ... do you really expect the youngsters of today, with all of their exposure to computers, the internet, cellphones, and all sorts of other sophisticated consumer electronics devices to actually be interested in recreating antiquated
stuff that the real world abandoned decades ago???

Now don't get me wrong, if YOU want to build stuff like that, that's fine with me ... but I think it's ridiculous to bemoan the fact that today's youth aren't interested in nostalgia radio when there are so many more useful and interesting things they could be doing with radio.

It's not at all possible.

The 565 is rated to 500KHz.

The phase detector is not really suitable for a synthesizer, being nothing more than a double balanced mixer. It has an AC component, and the detector is not suitable for wideband use because it will lock on harmonics.

The VCO, even if it could reach the HF range, is an RC VCO, so it will have way too much jitter.

The 565 and other Signetics PLL's are now thirty years old. They were pretty nifty at the time, but they were more for analog use than digital. While the application notes will show a programmable divider between the VCO and the phase detector, they really aren't suitable for that, and I think that sort of use was shown more to be all-inclusive than to be realistic.

Even if you could use the 565, you'd still need a reference (undoubtedly a crystal in the HF range, and a string of dividers to get you down to your channel spacing) and a programmable divider chain to select your desired frequency (and if you aren't going to control that with BCD switches, you'll need extra circuitry for connecting a dial to the divider chain). Considering all that, the 565 supplies a fairly insignificant part of the circuitry.

A 4046 or it's HC version hs a better phase detector. Again, though, you won't want to use the VCO because it's an RC VCO and it has frequency limitations. But the one of the phase detectors in there is as good as you're likely to see in some other device.

Of course, you'd still have to deal with the reference and programmable divider, and the VCO.

I don't know about availability, but Motorola (and probably others) make IC's that contain a good phase detector, an oscillator and divider chain for the reference, and the programmable divider, which are intended for synthesizer use. They certainly put a lot in one package, and at least some of the devices are fairly flexible.

Michael

Well...with further due respect I will point out that the thing that
got my 16-yr old out of his chair in front of the computer last night where
he had been 'glued' for the past several hours was the sound of CW coming
out of the TV set in the living room. No, it wasn't my ladder-line
re-radiating again ;-)...I had just put in a copy of the ZL9CI video that
9V1YC had been kind enough to send me into the VCR and he and I wound up
sitting down together and enjoyed watching an hour showing a dedicated group
of ops doing "stuff that the real world abandoned decades ago". Yes...the
metero sta. on Campbell is all automated now and all the data is up-linked
on each sat pass by computer, but there was something compelling enough to
attract a teenagers attention in what would motivate a dozen ops to endure a
long boat ride to a sub-Antarctic island and spend a month banging out QSO's
to ten's of thousand of people around the globe.
If you're the Last Dinasour...you've got some company ;-)

Aw, bingo! What can you do to "modernize" amateur radio that would
bring youngsters back into the hobby? Is "no-code" really the answer?
Unfortunately, from a strictly communications standpoint, whatever is
being done today with "modern" equipment was being done in the
40s and 50s with antiquated equipment. If the "magic" or radio is so
easily replaced by USING satellites, cellphones and computers, I see no
hope for the youth of America in becoming interested in modern electronics,
or ham radio, let alone "antiquated" technologies. Having a 16 year old
who is more interested in downloading .wav files, games, etc. than learning
how the computer works or how to program it, I do worry.

Regards

Pete K1ZJH

I wonder how many of these modern, enlightened youngsters have built a
computer,
a modem, a cell phone, etc. from scratch?

We "dinosaurs" built our radios, and experienced something in using
them that these "modern" kids never will (sadly).

It's like thinking you're some technical genius because you know how
to use a telephone.

There are a few of us "young" builders still out there . . .I'm 37 and have a basement full of type 30 tubes, Hammarlund coil forms, Velvet Verniers, peach crates and cotton-covered wire. I plan on "wasting" quite a bit of time this winter on several regen and superhet projects - and will enjoy every minute of it. To each his own.

I'll go with Marc on this one, it does make me wonder about the interests of youth today. I'm only 37 but I can remember the days of sitting and looking at *old* copies of Popular Mechanics and dreaming of all the neat stuff you could build. Boats, sleds, cottages, TV consoles, Teeder Todders etc. It used to drive me crazy because my dad was not a builder and we also didn't have the money for young Tim to throw&#65533; away on some silly project. Arrrrgh. Of course now I've got the money, just need to find the time. :)

I've mentioned building several projects with my kids, I turned over the Dremel Jigsaw to them, no interest. They've built a few birdhouse kits but only at Dads urging. At 8 years old I was using the same Dremel Jigsaw, I found a book of plans for bookshelves, shadowboxes, birdhouses, you name it. I think I made everything in the book. That saw ran all summer long.

While Amateur radio, and specifically building amateur gear may be in decline I don't think radio is all alone, I think in general the youth of today are in a different mode and really don't have the interest of hands on as the older crowd may have.

I agree with John, K6QQ in particular. It is a point well taken
that it isn't necessarily the "vintage" of the "hands on" project that
really counts, it is actually encouraging the young to participate in
any project that will enrich a storehouse of practical knowledge for
them. I am 50. I don't consider myself a homebrewer at all. However,
when I was 12 and a novice operator I did build a few Heathkits and
prior to that some simple breadboard projects. I do occassionally get
into an old rig such as my Viking II or KWS-1 to do maintenance and
minor repairs with an Elmer (even at my age). I have put together QRP
kits such as the NC 20 and found this to enrich a fabulous hobby, that I
will participate in to the end. I use the latest technologies too. The
analogy when referring to the youg would of couse be computers and ultra
solid state.
I drive a very high tech european import and at the same time get greasy
working on a vintage car. In radio, those who have knowlege and use of
the latest electronics will eventually investigate where it all came
from.
Bottom line...Don't dwell on the era, just continue to encourage hands
on activities that will enable generations now and to come, to move into
the future while embracing the rich past.
Thanks for the bandwidth,
Jack W6ABC

Hello..

I am presently working on a project and am in serious need of some recommendations. I am putting together a small 33cm ATV Xmtr but am having problems finding just the right transmitter. My plan is to feed 10-20 mW into a Down East 3310 PA and just run it like that. Problem is, I can't find a good transmitter to fit the bill. If you know of something that matches as many of these criteria as possible, PLEASE email me...

Synthesized
Only 10-20 mW or power controlled somehow
Small Size
FM Video
Reliable for extended operation
Clean output

All I've been able to find was some "spy transmitters" which are way too much money because they aren't designed for the amateur service. Help, please!

Interesting you mention it today; it's just in the past few weeks I started to getting into this idea, and tinkering a bit. I have learned so much repairing circuits, I figure building one will teach me even more. Plus I want to start making breadboard style radios that never existed for display purposes, as I think so many balloon tubes are just too nice to be hidden.

I'm 42, and I often feel like "The Kid" at swaps, then I go snowboarding and I am "The Old Man". No median is available :). I thought everybody WANTED it this way, Peter- it's the *OLD* Timer's Bulletin, after all. I won't get into a long tirade about this, people here know my views. I've heard a lot about how hard and with little thanks everyone toils to makes swaps possible, and that my criticisms are well intentioned but pointless. You can fight City Hall easier than AWA, evidently. Still, my hardest scheduling problem for my business (pool service) hasn't been any of my 40 customer's demands but figuring out how to go to Rochester for 6 hrs next week. This is a game for the retired, it seems clear.

How about an event specifically for kids at a swap/conference, with cool displays of breadboards and spark gaps- what kid could resist such a thing ? BUT- how many kids are going to come on a Weds or Thurs at 7 am ? It would have to be Sat at noon, or nothing. This would be a great way to teach electronics- Bardeen, Shockley and those guys where great, but transistors are BORING, awful, and dull compared to our glowing bottles. And kids NEED to learn about basic electronics today more than ever. The liability issues today, a opposed to the carefree 60's when I was making 12K Jacob's Ladders in the basement with bell wire and coat hangers, would make lower B+ voltage circuits essential, though.

Just a thought,
John H.

Try an Analog Devices
AD9851 DDS.

Add a 20Mhz reference osc and a good low pass filter and it will
generate 0->72Mhz under computer control.

The App note even has the design for the LP filter.

If you want another solution try an AD 9835 it will do 0->20Mhz and is
cheaper.

When I looked into getting a radio project "kit" like my uncle's old Heathkit I found out that Heath is out of that buisness. The only kit type receiver that I could find mention of, was the Ten-Tec 1254 mentioned in Passport. Paying $200 for a project that when completed has a reputation for being only "so-so" leads one to the natural q of why anybody would want one. Heck, it doesn't even have SSB and yet is said to take 24- 27 hours to complete to come up with something that is described as "no serious DX receiver". Yuk.

I don't mean to impune anybody else's hobby, but these days, for what amounts to a day's pay one can buy an off the shelf radio the size of a large paperback book that is technically superior to most anything the average basement tinkerer is likely to come up with in terms of ease of use and portability. As to putting together something with hard to find, delicate vacuum tubes, I just truly don't get it.

Homebrew radios, like homebrew computers are fast becoming anachronistic. Let's face it, those of us under 70 often have more disposable income than disposable time. I think that we all owe a debt of gratitude to those that sweated long hours coming up with solutions and configurations that are now standard, but the sun is setting on the sheer viability of the home built radio, computer or telescope.

repects,
ss.

Oh, I'm not so sure that building interest is totally dead. The internet (aka computers) has been a tremedous boost to the radio hobby. Now, for the first time, a relative newcomer has access to information that just wasn't available just a few years ago. More importantly, we have access to parts and old radios to restore and operate. I suspect that with more magazine articles like yours leading the way, that interest in vintage as well as modern electronics will build at all age levels. Besides, have you noticed the increase in kit manufacturer's lately; modern, yes, but 'building' none the less.

The vintage radio hobby is no different than vintage cars, guns, typewriters or whatever. It's fun to tinker with the past.

"John Moriarity" <k6qq@hdo.net> wrote:

>It's like thinking you're some technical genius because you know how
>to use a telephone.

I don't know about that. It's more like the amount of technology that is in daily use exceeds any individuals capacity to learn all of the fundamental nuances of each facet of all that we come in contact with daily. 30-40 years ago, an intellegent person really could pretty much keep up with changes in technology enough to become a jack-of-all trades and some knowledge of electronics, auto mechanics, refrigeration, biology, astronomy, mathematics, physics, chemistry, etc. was considered a standard for a well rounded individual. These days, technology advances so rapidly that keeping up with even just the important changes in any given field is just about a full time job in itself.

Who's to blame somebody for not really caring how a 30's vintage tube radio works, when just keeping up with necessary software upgrades is so time consuming? Today's focus is on the information, not the technology that brings the information. It's such a cliche' that few stop to think what it really means, but we're at a point where the technology age is giving way to the information age. The information about how to delvelop the technology to deliver the information, is just one small part of an ever complex spiral.

I'm a lot more interested in seeing young people just get engaged in learning _something_ that stimulates creativity and critical thinking than I am concerned whether or not they wish to laborously re-trace individual steps of those who've pioneered various technologies that are now taken for granted.

My final thought on this matter is that the tube radio technology is not sufficiently out of modern memory to be considered all that interesting. I note resurgences in interest of ancient processes, but those processes are usually more along the lines of truly old technologies that tie into self sufficientcy. It's not like the average tube builder ever personally made the filaments and blew the glass tubes. Rather, he relied on parts supplied by others, and these days whose to blame somebody for relying on resistors rather than tubes, or even whole radios rather than breadboards?

I wouldn't mind building something - probably would enjoy it too, but
I wouldn't want to build anything which duplicates any of the
equipment I have.

So tell me. Would it be possible - or practical - for a novice to
build a 23cm transceiver or transverter?

We builders are still here, at least in spirit.
I'm 42 and I still build things -when I can get the time!

That's the problem- time. Life is so rushed and harried now;
We all must work longer hours to have anywhere near the
buying power our parents had. I own two small businesses
and my wife works as a teacher's aide, and it's still
touch-n-go on the bills sometimes. The businesses eat
so much time that months can go by before I can heat
a soldering iron again. And keeping up with email?
I have 172 pieces in my inbox right now, at least
2/3rds of which will require a personal response.

tempus edax rerum!

That's one area where building kits has changed. With printed circuits and automated assembly techniques, production assembly is no longer so labor intensive. It is now often less expensive to assemble a rig than to write and print a manual to tell someone else how to do it. That is, at least in part, what put Heathkit out of business. For the most part you no longer build a kit to save money. You do it because you enjoy building, operating, and understanding a rig you put together yourself (even if it cost the same or more).

The people who do things the hard way are the people who had no choice.
In this modern age, things are not as hard and everything comes pre-made,
thus people don't have to build radio's from scratch anymore.
That is why old hams are the ones who build radios, because they had to.

Consider this- most antique radios today, in working condition, sell for the same price as when they were made. You can buy a radio that cost a year's wages in 1934 for a week's wages today. And you could buy the same function (i.e. a good sounding radio) for less than a day's wages.

Face it, we just want more from life. Look, I'm a pool guy- I just got back from my rounds of suburbia. And a lot of us have more toys than our parents ever dreamed of calling essential, IMHO, and more than we have time to play with (the irony of this seems to escape people).

Hi Peter,

I think people are still building things, even things using tubes, they just aren't building tube radios. If you want to see dozens of people building audio amplifiers with tubes, you have only to look in rec.audio.tubes. In the realm radios, if you look around you can find a lot of people building crystal sets. I suspect the attraction of crystal sets lies in their ease of construction and tweaking, which is a result of their simplicity. Tube radio building seems to be a less popular avocation than building crystal sets, or tube audio equipment. There still people still building electronic equipment from parts.

Regards,

John Byrns

WinDraft and WinBoard are two excellent programs--the price depends
on the number of "pins" the software is registered for. I believe you can
download and try the programs at the ivex.com website. They are also
sold thru NTE distributors.

Expect some steep "learning curves" if you have never used autocad
before. I mainly use the WinDraft program for schematic work, but I
have never mastered the netlists, etc. Of course, there is nothing
preventing
you from manually creating the pc board artwork using WinBoard--and for
RF circuits that may be the preferred method.

For some reason (???) my first call returns an error-message.
So here the question again:

I'am searching for constructiondetails and/or measures
from the Norcal Paddles or, even better, a not used set of the
brass parts. Homebrewing is easy when you can use machines
and not only saw and file?
I already have enough JPEG/GIFF pictures!

Any info is welcome. Pse mail to: cmulder@casema.net

This is a fascinating thread. I agree with a number of points that have already been made, and won't repeat them. I do have a couple of additional comments.

My website's project/restoration section includes instructions on how to build a crystal shortwave receiver. We get a steady trickle of mail from people who are building this radio, so I guess there is still some interest out there in exploring "old" technology.

If I fix and old radio or build a one-tube set from scratch, it's a nostalgic activity. But the old-timers were technically *progressive* in their time. It was a forward-looking activity to build a radio from scratch in the days when factory-made radios were just starting to appear. Radio was not "old-time" in the 1920s -- it was cutting-edge technology!

We're being a little hard on today's kids to condemn them for lack of interest in 70-year old technology. The old-timers building 1920s radios were exploring the technology of *their* day, not reviving 70-year old techniques in ginning cotton or whittling barn stools.

If the old-timers were alive and the same age in the 1990s, they would be exploring 1990s technology, and I tend to think it would be more along the lines of software than hardware.

The underlying hardware has become disposable, non-user-repairable, and thus not terribly interesting. My younger son is very mechanically inclined, and loves to gather old found junk or spare parts from my garage to fashion a "machine." Unfortunately, a lot of his raw materials -- a smashed cel phone he found on the street, innards of a solid-state CD player put out in the neighbor's trash, etc. -- contain no useful reusable parts. It's fun to pretend that a cel phone scotch-taped to a CD player lets you broadcast music to ET. But I daresay few people on earth could take the parts from those two items and make something new and useful from them.

Software -- programming your computer, creating a databasem building an interactive website, etc. -- is the layer where an average person can accomplish something interesting and fun nowadays. Maybe the year 2000 analogue of building your own regen receiver is building your own website!

Cheers.

Again, that just about nails it.

Think of the PCS cellular telephone I now use exclusively instead of a landline. My father probably took his share of telephones apart in his youth, and in doing so he would have gained enough knowledge to exhaustively understand the technology in the course of a weekend or two, perhaps with the aid of one or two elementary electronics books written for laymen. The most complex, abstract part of a telephone 30 years ago was its hybrid network. And once you understand what a transformer does, you're 90% of the way to understanding a hybrid.

Now, suppose I were to take apart my Qualcomm PCS phone in an attempt to learn how it work(ed). Contemplating its "guts" spread all over the workbench, I might as well be looking at the remnants of the Roswell alien autopsy. There is nothing to be learned from such a sterile experience, unless I already have a thorough understanding of what I'm looking at. There are few if any parts I can cannibalize from the corpse to tinker with or use in another project. I might spend a whole month studying a monolithic phase-locked VCO chip -- even probing it with a VOM, oscilloscope, or, hell, a vector network analyzer. But that won't tell me how the phone as a whole works -- only one small part of it. By the time an inquisitive kid figures out anything meaningful about the way a telephone works nowadays, it'll be obsolete anyway! (Which is obvious to anyone sentient enough to use the phone in the first place.) Much the same, I think, is true of modern communications

systems ("radios").

Indeed. It would be a sad way of repaying the giants on whose shoulders we now stand, if we were all content to follow in their footsteps instead!

The key point is, hacking code on my old 48K Apple][+ was just as important (and, dare I say, romantic?) a formative experience for me as taking apart phones and building radios was for my father. I also spent plenty of time as a kid building and playing with tube (and transistor, and IC) radios, but in retrospect it's a damned good thing I didn't stick with that particular path in life. For many practitioners, even the once-creative art of electrical engineering has become little more than a competitive cost-reduction game these days. An EE's job still demands creativity -- arguably more than ever, in fact -- but it also pretty much rules out most opportunities to stand back and appreciate the technology for its own sake. For all but a few lucky engineers, modern electronics as a career seems to be just another high-stress numbers game.

> ss.

Right on. That's exactly what continues to make electronics interesting as a hobby (if not a career) from my point of view. All of that integration puts an awe-inspiring amount of power in the hands of people who take the time to understand how to wield it. Using a recent pet project of mine as an example, I couldn't have built a 10-megabit microwave link out of tubes. Or even discrete transistors, without a lot more effort than I would have ever wanted to put into it. There has never been a better time for a hobbyist to partake of the fruits of technological innovation -- even if you have to do it for a living, too. :-)

That being said, building HF gear out of tubes is a different matter entirely. That might be a perfectly reasonable hobby, just like playing with model trains or reproducing the Eiffel tower from matchsticks. But

you can't confuse it with what we now call "radio" or "electronics." It also seems safe to predict that 500 years from now, when it's time for the "resurgence of interest" you speak of, it won't be possible to hear anything but atmospheric static on a homebrew vacuum-tube radio.

SMT (surface mount technology) isn't any harder to work
with than through-hole parts ... it just takes different tools
(not a fortune in them, either) and different techniques.

In fact, it's a LOT easier to remove a multi-lead SMT
device from the board and replace it without damaging
the board than it is to do the same with a through-hole
part.

I don't understand the part about making PCBs being
harder ... could you elaborate on that one?

A related legend is the guy who had one of those high-voltage
lines going by, near his property, so he strung up a wire
parallel to it, picking up power for free via induction. Yah,
Right. He's supposed to even have got busted for stealing
power.

It would be kind of an interesting experiment, though. (to
string a wire parallel to the lines, to see what kind of
power you actually could get - maybe a watt or two, I'd
think, if it's close enough to one of the phases.)

Cheers!
Rich

Ed,

I disagree, in the "good old days", Electrical Engineering and Power
Engineering were basically the same thing. EE was never basically the
same thing as Radio Engineering. EE went straight from Power Engineering,
through a short period without a definite identity, to Computer
Engineering.

Perhaps in the traditional sense. However, aren't cell phones, pcs, wireless modems, and satellite links all "radio"? Who's designing all the new hi-tech communications systems that are showing up on the market?

What follows this ckt? I have found that it is tough to get good
stability in a "straight through" system, that is, if amps follow the
VFO and output much power on the same freq. Have you tryed feeding the
output of your ckt into a resistor of various values to check the
pulling? If not, try that and see if there is less effect. If so, then
I would suspect the problem as described above.

Guy's in their forties, like myself. But your point is well taken, there
is a great demand for electrical engineers that design radios, filters,
and amplifiers. I shifted from low noise-low frequency audio design
to microwave filter design six years ago within my same company.
Fortunately, my company recognized the learning curve, and now
I have a niche position.
It may take 2 or 3 years for a new graduate to
become proficient with radio design, and top communications companies
are aware of that and provide mentors and training.

Dear SS, and the rest of this thread,
Pete you certainly got the responses out of the woodwork. Thanks for asking the question. And for the excellent discussion points.

I would comment however to "SS" that he might want to check out www.tentec.com and their kits, they produced a 1253 which was intended as a starter radio and originally sold for $24.00, I see that the current price for the "improved" version is $59.00 but it would provide an excellent way to experience the "regenerative days of old" which had the sensitivity of modern equipment, but with simpler circuitry. As I see it the tradeoff being that the digital radio of today does not require the jockeying back and forth between controls to peak the circuitry to hear the weak stations.

To add heresy to this thread, I'll offer my "radical" thoughts. As a 65 year old grandpa, I am attempting to create a kit of parts that my grandchildren (ages 9, 8, and 5) might read and build with. It will build a crystal set, complete with galena crystal and mount, plus a 1N34 for when finding the hot spot gets too problematical. And, it will build a regenerative receiver with a J-FET and amplifier module that I will supply.

My intent for this kit is to see if there is any interest - inquisitiveness into the electronics / sciences field. I figure that the one thing that I have to pass on to the following generations is the curiosity of what makes things tick, and how to go about finding out the answers. I also have a single 201A regenerative receiver that I plan to use as a "show and tell" piece to demonstrate how the "old timers" did things.

I realized the need to try and spark this quest for information when I had made a casual comment with some fellow worker, on wondering how plastic interlinking chain must be manufactured. While he didn't have a clue, he made the comment that "only you would ask that question". And, I saw that many people do take modern technology on faith, and have NO CLUE as to what marvel they are working with. Stop and think about the automatic transmission in automobiles -- a mechanical computer; who among this group knows the details of the algorithms involved in making shift decisions, of more to the point -- cares??? We just get into the cars and put it into drive and go.

Sorry that I get so long winded, but it's hard to get off the soap box when I get wound up. Thanks again Pete.

Regards,
Denis

SMT parts use fine enough lead spacing that you pretty much have to use photographic methods to make boards that use them, it seems to me.

I've made a number of PC boards for through-hole parts by directly drawing on the copper with a resist pen. I've done others by covering the board with adhesive packing tape, then slitting it with a knife and peeling off the tape wherever I wanted the copper etched away. I've seen someone describe a technique that involves cutting the copper directly with a Dremel tool and abrasive wheel. All of these are practical for boards that use 0.1 inch spacing through-hole parts, with no traces between pins.

But once you need to run traces between pins at 0.1 inch pitch, or start working with chips that have 0.05 inch lead spacing, these methods seem unlikely to produce working boards very often.

So, you need a more precise technique, and these generally involve photosensitive PC boards and exposure frames and deveoper, or a computer and a laser printer, or both. If you don't already have any of that equipment, it seems like a lot of additional hardware and technique just to make use of one surface-mount part.

Dave

Well, the short answer is that you can indeed collect electric power by making a long loop antenna beneath a high-voltage power line. It's typically not illegal to do so, but the electric utilities don't like it because the practice exposes both customers and line personnel to shock hazards.

When a farmer fences off his land along an electric utility's right-of-way, the fence often becomes a shock hazard. The electric utility has a fence crew that works along the right-of-way, installing insulators and grounds on fences. There have been a few accidents, like fires resulting from arcs between a fence and a tractor during refueling.

It's true that not much power can be collected from an electric power line through an antenna. The secret power theft book I saw once sniffed that "...a wind charger would probably be more effective."

I don't know about power collection from radio stations. I'm not certain that it wouldn't indeed be possible to build a collection antenna that was efficient enough to alter the pattern slightly. The effect of such an antenna would be that of another antenna close to the radio station broadcasting the identical signal out of phase. This would indeed cancel some of the broadcast signal. It's difficult to imagine that power so obtained would be particularly handy to use, though. And you'd sure have to like the format of that radio station: you'd hear the modulation signal everywhere, whether you had a radio receiver or not.

If you don't mind a square wave output you can do what I did.
A CMOS buffer, biased linearly (o/p to i/p via a meg)
and coupled to the VFO with a very small cap worked fine.
I just ran thru another buffer (there are 6) for luck,
then used the other 4 paralled as a driver.

How about mounting the leds on a piece on circuit board material,
you can paint the front (before inserting and soldering the leds).
Then cut a large hole in the box and mate it with the circuit board.
Traces on the back make it easy to connect the leds too.

Depends... Electrical E. - true - Electronics Engineering - was the same as - and some schools did (and still do) offer both. As a student - without much money - I went to a community college (they were called Junior colleges then) which offered both - I took the EsE courses. Cal-Poly - whos campus literally backed up to Mt. SACs (Mount San Antonio College) - also offered (and still does offer) both. The prep classes are the same - but once into your "major" - they were different. There was even a major difference in the degrees issued - Electrical Engineering got an Associate in Science - while Electronics Engineering got an AA - Associate in Arts. The year I attended - they finally got the school - and the accrediting body to change the Electronics degree to an AS

> EE went straight from Power Engineering,
> through a short period without a definite identity, to Computer
> Engineering.

I think many schools have combined the two EEs into one - and yes - they do seem VERY slanted towards embedded systems (various types of computers), etc.

It was a wake-up call to me a couple of years ago - when talking to a recent BE graduate - that he had a difficult time with the idea of a "self powered" radio... he really had to see (hear) one work to believe that enough power could be recovered from the micro volts of a radio signal to drive a transducer to audible levels - any type of re-producer. Crystals? sure if you want to talk semi-conductor substrate and growth of junctions - or even their tendency to exhibit electrical characteristics changes based on wavelength - (commonly known as resonance)... but a crystal as a point contact detector driving another as a transducer??? Had to see (hear) it to believe it!!!!!

Perhaps I'm a "fuddy-duddy" - but I believe there is much to be learned from history both of what works - and what we should avoid --- and it's obviously NOT being thoroughly taught - at least in some places...

best regards...

Sounds like a great way to get electrocuted, too. If you're going to steal power by induction from power lines, obviously (in theory) you want to use lines with the highest magnetic fields, and thus highest currents. These won't necessarily be the highest voltage lines, but probably will be (despite what you read about transformers and power distribution), since trunk lines actually usually carry more current as well as higher voltage, and the much higher currents which result from sub-station step-down are distributed over many wires, so you don't see them ever in one wire.

The simplest thing is run a direct tap from a local pole transformer if you're going to steal power. Which you hardly have to climb the pole to do (risking getting fried on the local secondary grid)-- all you have to do is use the existing power tap, and bypass your power meter at the house. Of course, this has been thought of, and the local subgrids are monitored for consumption, and if all local readings on a secondary don't add up to what the meters on houses do, to some fair approximation, they'll do some careful checking to see who's running around a meter on your street. So what you can steal and get away with, isn't much. Or you would put an insulated induction coil around the transformer, but naturally the loss would again show up, or else the device would be detected in short order the next time the transformer was checked and serviced, and then they'd follow the line right to you, the ciminal. A dumber crime can hardly be imagined. Unless possibly the one where you want to string up next to the high-amp high-tension line, of course.

>
>You were misinformed. Nobody gets life imprisonment in the US for much of
>anything short of murder, treason, or a very large inventory of illegal
>drugs.

Under the California's "three strikes" law you could get 25 yours for a third conviction after two felonies, and third didn't even have to be a felony. Shoplifting would do it. There were several celebrated cases of rather minor crimes putting somebody way for 25 years. I do not know if the law is still on the books, but was for a long time.

Second, the amount of some drugs you have to have to put you in Federal prison for life (effectively) is not large, depending on the drug. I don't have the tables, but a kg of crack cocaine would certainly do it. You could put that in a purse and it's not what one thinks of as a large inventory, unless you have a different idea of the word than I do.

> Theft without breaking and entering is never more than a
>misdemeanor.

Wrongo. It goes felony based on value in all states. Steal a tractor or backhoe, go to prison. Matters not if the keys were in it, no breaking required. Furthermore, if you have an accomplice, conspiracy is a felony all by itself, even if you never comit the crime. In fact, under federal law it is actually a felony to conspire to comit a misdemenor. A law no often enforced, but certainly on the books. And there are a lot of people doing federal time due to extra "conspiracy" convictions, all felonies. Juries really have no idea how harsh Federal penalties are, and how little latitude judges have in applying them, once a conviction has been made.

>
>>Justice is still only for the rich is it not?
>
>Not here. The courts here in Athens County regularly appoint local
>attorneys to represent indigent defendents. I've watched it happen.

Have you watched those attorneys work? It wasn't long ago that Alabama paid the state legal defender $1000 to prepare a death penalty

defense, something that most lawyers say takes at least 500 hours to do adequately. That's $2 an hour. What do you suppose the quality is like? So you can watch all you like, but until the state makes equal resources available to defense as are available to prosecution, there will be no justice in any terms you can imagine, for people who aren't wealthy. For everyone else, the prosecution IS the punishment. No matter how it ends.

>If you come to visit the US, stop in and watch some court proceedings:
>except for juvenile cases, they're always open to the public and the
>press.

On second thought, don't. If you want to retain any regard for sausages or the law, don't watch either one made (Bismarck). This goes also for criminal court proceedings.

>Maybe that's the case in Europe, but not here in the US. Our
>legislators are citizens like everyone else, and they have to stand
>for re-election every other year.

So what? It's not like they feel much of the impact of the laws they pass, while they're in the legislature. The legislator is not running a business, or being an employee in one. By the time he gets out of the game and finds out what he's done, it's way too late. As for the people, they hardly know who to blame for what. Legislators lie, and nobody really has the resources to find out who's actually responsible for what. As congress votes on 1000 page documents that not one of them has actually read all the way through, not even they know.

> Again, you're welcome to visit our Capitol building and
>watch our House of Representatives and Senate in session.

If you have the stomach for it. You can do it on CNN. It all looks mighty impressive until you listen to what is actually being said. As JFK liked to tell the story, when he first got to congress one old Texas senator told him not to worry-- that he'd spend the first few months wondering how he got there, and the rest of the time wondering how everyone else did. No truer thing was ever said.

>Thousands of
>people do so each year, and most sessions are televised as well.

The speeches in the hall (now for TV) are televised. Closed door sessions, voice votes, and the important dickering in committees (where the real stuff is done) is mostly not. So you can't even choose not to follow Bismark's advice. By and large, you don't get to watch. You just get to pay.

Great thread! "To each his own" seems to be the bottom line, but let me throw in a few more ideas on the benefits of playing with dead, old technology.

-- There is a satisfaction that comes from listening to a radio that you built yourself that you will never get from a store-bought radio. I like to work on circuits that are a simple as possible, circuits that are within my capacity to understand at the component level. For this reason I try to avoid ICs. For me they are often mysterious black boxes and detract from the HB satisfaction.

-- There is a challenge to building this simple stuff. Even if the circuitry is old, outdated and simple, it is NOT easy to get a homebrew receiver working properly.

-- Don't write off homebrew gear as inherently inferior to the commercial stuff. As I type I'm listening on a homebrew receiver to VK7FJ in QSO with TF3DX on 20 cw (I can hear them both).

-- I learn something every time I build one of these things. Manual dexterity improves, shop skills improve and (especially in the debugging phase) I learn some of the electronics.

-- When you build simple and/or old radios like this, you are, I think, getting closer to the physics and science of radio than you do with some of the more modern techniques. I earlier said some positive things about those inventive kids who are hacking away at new software. That's great, but I got tired of it real fast and found myself going back to the old simple radio hardware. For me, working on the software seemed very removed from the science and physics of radio. I was just making sure that the code was written right and in the right sequence etc. Look at the debugging phase: with software you are often looking through the code to see if you put a comma where you should have put a semicolon. With a simple radio, you have to think about where the electrons are going.

-- Playing with this stuff gives you a personal connection to the history of radio. I read about tickling crystals but didn't really understand it until I did it myself. I'd read about the joys and difficulties of regen receivers, but didn't really appreciate it until I built and used one myself.

Again, To each his own...

Can anyone show me where I can find out information on meaning
of the parameters used in Gummel-Poon transistor model?

I was studying an article on LNA design (June 1994 of RF
Design). It uses NEC NE68519. The model the data sheet gave were in
Gummel-Poon model. I'm wondering if someone can point me to where I
may find a figure of the transistor model so I may understand what
each parameter represent and use it in in ARRL Radio Designer.
Thanks.

Oliver

I need help locating a computer program. The program may have originally been on one of the early 90's Buckmaster CD's. Some of you may be interested in the program and hoping someone knows of the program. I have lost track of it and would like to find it again. The program had several functions, but the one I used and liked did the following: Start the program, tune your receiver to a signal or beacon, rotate beam antenna from stop to stop (360 deg), At the end of the rotation the program would display on screen a picture of the antenna receive pattern. As I find the receive pattern is very close to the transmit pattern in most cases, the program was very useful. The only connection needed was to connect receive audio to the computer soundcard. I have no idea of the program name or who wrote it. Sure hope one of you knows. Please drop me a note if you can help. Thanks, Bill, KG8AW

Agreed that primitive technologies are fundamentally easier to
comprehend than more complex ones. That's why I'm concerned
about the general decline in the technical competency of the
average ham today compared to the ham of yesteryear. We're
*supposed* to self-educate and keep up with the times, not
stagnate in the technology of the past simply because it meets
the recreational needs of the moment for some.

> Now, suppose I were to take apart my Qualcomm PCS phone in an
attempt to

I'm
> looking at.

If you have a good grasp of the basics of modern technology, you can
figure out quite a few things. Observe the ground planes, shield
partitioning,
and other aspects and follow a few traces from the antenna backwards
to
help you figure out which areas do what ... try searching out the
part numbers
on the ICs on the web, download the .pdf datasheets, and look at the
specs,
```

functional block diagrams and applications information.

> There are few if any parts I can cannibalize from the

I believe you'll find a coherent explaination of the principles of how
the CDMA phones work at http://people.qualcomm.com/karn/cdma.html
if you're actually interested. (I believe it's in compressed
PostScript form,
you may need GhostScript/Ghostview [do a web search, it's a useful
tool to
have].)

> By the time an inquisitive kid figures out anything meaningful
> about the way a telephone works nowadays, it'll be obsolete anyway!

You really think that "inquisitive kids" read that slowly today? Even
if your assertion were true, he/she'd be a WHOLE lot closer to today's
technical realities than he/she'd EVER get building one of Jeff
Herman's
1 or 2 transistor MOPA CW transmitters.

> (Which is obvious to anyone sentient enough to use the phone in the
> first place.) Much the same, I think, is true of modern
communications
> systems ("radios").

Are you asserting that because it's "harder to understand" modern
communications techniques we should all just forget about it and be
satisfied with being rice-box-operating CB-like communicators who
don't understand how/why their rigs work? I take strenuous exception
to that concept if that's truly what you're saying.

As one who *did* follow that path, I respectfully disagree. Yes there
are pressures to reduce costs, improve performance, and to get to
market "on time" ... but those pressures demand both creativity and
the ability to appreciate the technology ... so that one can visualize
new solutions to old problems.

I would agree with that, but that does NOT require the use of
"dead" technologies like regen receivers and 1 tube MOPA
transmitters. (more on this below)

> I like to work on circuits that are a simple as possible, circuits
> that are within my capacity to understand at the component level.
For
> this reason I try to avoid ICs. For me they are often mysterious

Most IC datasheets provide a complete functional block diagram,
theory of operation, and some even provide some transistor-level
description of at least parts of the internals. Once you understand
how a Gilbert Cell double-balanced mixer works, do you REALLY
need the "gory details" about the one in any given IC? I don't think
so. Think of ICs as "super components" which actually ease the
task of building things. They aren't so "mysterious" if you read the
data sheets and understand the underlying principles of the functional
blocks they contain.

> -- There is a challenge to building this simple stuff. Even if the
> circuitry is old, outdated and simple, it is NOT easy to get a
> homebrew receiver working properly.

Particularly if it's an inferior design to begin with, notorious
for instability and problems.

> -- Don't write off homebrew gear as inherently inferior to the
> commercial stuff. As I type I'm listening on a homebrew receiver to
> VK7FJ in QSO with TF3DX on 20 cw (I can hear them both).

That doesn't say anything about the level of performance of your
receiver. What's its MDS sensitivity? 12 dB SINAD sensitivity?
IIP3? IIP2? Spurious free dynamic range? Adjacent channel
rejection? (I could go on, but hopefully you get the idea.) ALL
that your statement that you could hear those two stations said
was that they were suficiently strong at your location at that time.
It does NOT "prove" that you have a receiver of any particular
level of "quality."

> -- I learn something every time I build one of these things. Manual
> dexterity improves, shop skills improve and (especially in the
> debugging phase) I learn some of the electronics.

That's all good ... great, in fact ... however, if you built something
that was more in line with contemporary technology than that
of decades ago the things you learn would be more useful, more
relevant to the world we live in, and the result would undoubtedly
be a better radio for you to ultimately use.

> -- When you build simple and/or old radios like this, you are, I
> think, getting closer to the physics and science of radio than you
do
> with some of the more modern techniques.

The "physics and science" haven't changed ... mankind simply has
a more complete and useful understanding of them and how to apply
them. If anything, working with modern techniques will teach you
more (and demand that you learn a bit of new stuff.)

> Again, To each his own...

Certainly ... I'm not condemning you for what you're doing ... just
tring to point out that working with more modern technology is
not "hopeless" as you seem to think, would result in your learning
more useful information, and would result in both a better radio
and a more competent ham.

Not so ... perhaps the UT@A has chosen to focus on other specialty
fields. However, MANY universities have programs which are very
focused on wireless (radio) communications. (CALTECH, UC Davis,
UCLA, and many others) While I'll grant you that even the MSEEs
coming out of many of these programs need some practical, real world
experience to become seasoned engineers, they ARE well-grounded
in the fundamental technical knowledge.

Your prejudices are showing ... "radio" (wireless in the RF frequency
range)
is a means of conveying information from one place to another without
wires.
TV is just a form of radio comunications, as is CW, SSB, FM, all the
digital
modes, cellphones, PCS, and every other form you could list.

If you're saying that society's use of radio communications is
changing and
maturing, that's correct. However, to "pigeon-hole" "radio" into just
```

audible
forms of communication is both unrealistic and too confining. And,
yes,
doing so will restrict the number of youth who will join our ranks ...
being
used to the "content rich" multi-media experience of the internet and
the
instant availability of cellphone communications, they can
understandably
be left with a "That's all there is???" reaction to today's ham radio,
which
is stuck in a time-warp of the 50's or 60's at best.

Go to your local movie rental place and rent "Pleasantville" ... it's
entertaining,
but it might also open your eyes a bit to the fact that change is
inevitable and
that fighting it only results in unnecessary conflict which won't stop
change
anyway.

> members.

"Plugging" it over and over again won't make it interesting,
particularly
to the youth of today. Enjoy it if you do, but don't bemoan the fact
that
virtually everyone else finds tubes and regen receivers boring and
inferior.
To do so will only cause you more frustration and disappointment
because
the world is NOT going to go back to "the good old days" and you can't
keep it from advancing.

>

You saying that with software you don't have to think? Them's fightin'
words, Bill! :-)

Seriously though, software is as much engineering as RF. The reason you
weren't having fun is because the software was too simple. If all you're
worried about is the sequences and typos, you're just playing. It's like
worrying if you've gotten your wires crossed on a light bulb/battery
circuit. The real science comes in when you design a system that actually
does something complicated. Real-time timing constraints, asynchronous
events, user interface issues, processing algorithms, etc. that don't show
up in the little toy applications done by beginners are what demand exactly
the same type of creative, innovative, careful and scientific thinking that
the level of RF engineering you're used to demands. To paraphrase someone,
with real software you have to think about where the information is going.

And if software seems too removed from radios for you, consider this - with
today's DSP technology you can implement an AM/FM/CW/SSB/FSK radio almost
entirely in software. This is about as connected to the real world of radios
as you can get. And in a symmetry that I find very pleasing, the computers
that let you do this are implemented almost completely with RF techniques.
So, it's all 2 sides of the same coin. Have fun on yours, but remember that
you're most cordially invited over to the software side to play, and we'd
love to have you stay a while and do some engineering. In the meantime, I
need to get back to soldering up my 2-transistor, 1 IC 100% homebrew regen
receiver.

>
>I don't find any "magic" in that ...

You are missing the point. I am not talking about a high tech.
magazine like Communications Quarterly, but rather a magazine
that primarily serves a scanner and SWL based readership.
These are folks, for the most part, who have never seen a regenerative
circuit, or even a resistor or capacitor. For them, it is something new,
and something that is comprehensible given a proper instructor
and a graduated learning curve. If you can blend a column that deals
with restoration, basic electronic skills, and also offers some "hands-on"
reinforcement, it is an accomplishment, even it only brings a small
fraction
into the fold. The folks who did build the receiver at least have some
technical
knowledge of how it works, and an enormous sense of pride in their
accomplishment.
Why do you elect to belittle their efforts?

For a non-technical person to build even a simple "primitive" receiver,
and to have it work, brings a sense of accomplishment--or even "magic".
Hopefully, it will lead to deeper interest in the current levels of
technology. For
some, it is an enjoyable end in itself. Besides, what is it about "hobby"
that
needs further clarification?
>
>I can't for the life of me understand why anyone would
>be attracted to waste the time in such an endeavour when
>there are so many more useful, more interesting things
>well within reach.
>

Sure, maybe for you, but not for a non-technical based readership.
Beginners don't want to mess with circuit boards, and small semiconductors.
These folks do have basic household tools like screwdrivers
and pliers and can handle what is
being presented. Circuit board projects will be done, but that involves
having a supplier for the boards, and an infallible list of suppliers, and
even
a presentation of rudimentary soldering skills.

>today's youth aren't interested in nostalgia radio when there are
>so many more useful and interesting things they could be doing
>with radio.

Come on, what more interesting and useful things are today's youth
doing with radio? We are faced with an aging fraternity, a dumbed
down licensing structure, and folks with licenses who can't even cut
a dipole. I know, I know, rather stupid to expect them to do so when
you can buy one. On one hand you support no-code, and on the other
you can't comprehend why it is important to start their journey on
a very basic and elementary level. The ends sometimes justify the means.

Probably a level of performance that would shame any HF receiver
with an NE612 Gilbert Cell mixer in the frontend.

> Thanks.

SPICE programs use Gummel-Poon parameters to establish an operating point for a BJT, and from there a small-signal equivalent circuit. In SPICE the two-port S-parameters for the transistor can be found by simulating a two-port test circuit (50 ohm gen, 50 ohm load) that is based on these G-P parameters.

When these S-parameters are found at a set of frequencies they can be used by ARD, employing the Circles Utility for amplifier and matching network design, which "low-end" SPICE programs do not have.

There is absolutely nothing to say that English law is sane. The
situation could have arisen through one of Henry VIIth's scribes being
drunk and missing out a line of text in a copy parchment!

We had no laws against female homosexual offences for around 100 years
because no-one dared tell Queen Victoria that they existed!

You seem to feel you have the authority to speak for everyone else?
Virtually everyone else in the current generation do not even know what
a tube or regen receiver is and they just might not find them as boring
as you seem to think.
According to you way of thinking we should close all the museums, after
all, way would anyone be interested in all that old stuff, just forget
the past, that is what most of the current generation wants to do
anyway. You think like them, which is "if I didn't have anything to do
with it, it isn't worth remembering."

> photosensitive PC boards and exposure frames and deveoper, or a
computer
> and a laser printer, or both. If you don't already have any of that
> equipment, it seems like a lot of additional hardware and technique
> just to make use of one surface-mount part.

What are you going to do in a few more years when through-hole
parts are no longer available? Industry is going to SMT. Soon
through-hole parts will be as scarce as octal tube sockets and
Nuvistors ... if you want to build, you're going to have to learn,
prepare, and adapt.
```

It isn't that hard, just different ... all it takes is some
self-education
and minimal equipment.

Phrases like "more useful", "more competent", "more relevant", "level
of performance", "spurious free", "level of quality" "inferior
design", and "dead technologies" conjure up images of the
hard-working engineer who's trying to compete, excel, get it right. I
work as an electronics professional, and I've see lots of these

people. They're usually tired all the time, one project away from getting it right, and one week away from burnout. Frankly, I felt tired after reading your narrative, not motivated.

I think seeing *beyond* technology is the key to discovery. Radio is magic, truely. All the techno-logical progress in the world can't hide it. Build a radio yourself, with you own two little paddy-paws, and the magic grabs you. Can we do it better? Sure! Do we have to, to experience its magic? Heck, no!

What about the smile that spreads across your face when you or your kiddo flip the switch and sound comes out of the speaker you wired up yourself, outta stuff you built from grampa's junk box? Magic. Or the warm feeling that wells up inside your chest when you tweak that regen control and the beat note suddenly appears out of a bunch of clicking hisses? Magic. Or the feeling of appreciation that comes over you when you see a production- hardened EE encouraging a youngster to complete his first radio kit? Magic. Or just the sense of satisfaction that you feel when you tweak a tuned circuit and have a (dare I mention it?) bipolar transitor IF amplifier spring to life? To me, that's FUN... [but as to being more relevant... nnnaaaahhh...]

34 years ago when I was a mere teeny-bopper, I remember being invited into a ham's "shack". It was full of big gray and black boxes, some shiny and new, some obsolete WWII surplus. It was quite impressive. On the kitchen table, there was a 2x2 foot square of masonite, with four or five tubes mounted on top, and coils wound on toilet-paper rolls. When I asked about it, his face lit up. He reached in and connected a wire with an alligator clip, and the tubes turned orange, and in a few seconds there were sounds of morse code and quacky voices. State of the art? I don't think so. Magic! You bet!

Now, I don't have a bunch of letters past my name (I'll offer just the 4 the FCC granted me), so I won't try to refute the accuracy of your comments, they're probably technically correct. And I'll betcha that you do something just for fun in your life, Carl, but apparently it's not homebrewing electronics. Really, what makes you smile, Carl?

>[stuff deleted]

"Empire of the Air" is a good book about those three. The name of the
author might be Tom Lewis; certainly that's the name that comes to mind.
There was a PBS show some years back with the same name, interesting too,
though I don't know if it was based on the book or both were done in
conjunction with each other. I meant to buy it when it came out, never
got around to it, and finally read it last year when I joined the library
for the first time since I was a kid. (I lost interest in the library
about the time I'd worked through all the available books on electronics
and radio, and rejoined when I realized I was missing a lot of books that
I wanted to read because of cost.)

"Man of High Fidelity: Edwin Howard Armstrong" by Lawrence Lessing is the
book about Armstrong that I've read. It came out in hardcover originally,
but made it into a Bantam paperback thirty years ago. I found a used copy
about fifteen years ago, and I've seen other copies since.

If we're on the topic of inventors, I found "A Streak of Luck" by Robert
Conot an interesting biography of Thomas Edison. It too went from
hardcover to a Bantam paperback editition that came out in 1980.
Electricity is so common place, I found it interesting to read about how
the original electrical wiring inside houses were owned by the company,

and the wires were soldered to the bulbs because nobody envisioned it as anything but a lighting system.

"Tesla: Man out of Time" by Margaret Cheney. This is a Dell paperback from 1981. Tesla had influence on the others.

I don't have it handy, but the first bibliography I read of an electrical/electronic inventor, maybe any inventor at all, was a book about Charles Proteus Steinmetz that I bought from the Scholastic Book Service when I was in elemntary school. I still have it, but not at hand.

I imagine there were/are more scholarly biographies of these inventors, perhaps some that were even aimed at the technologically aware. But these are instances of them getting into the public eye.

I'm reading an interesting book from the library right now that is along the same lines. "The Invention That Changed the World" by Robert Buderi. Copyright 1996, and published by Simon and Schuster. It's about the work on Radar just before, and during, World War II, and where it lead after that. It's not a technical book, and makes only a brief mention of Armstrong which doesn't acknowledge his true importance, but it was a period of great advancements in a very short time.

Yes, reading the history is just as important as knoweing the theory that these people brought us.

Hi!

Can you recommend any good books on Major Armstrong? I for one would enjoy reading about him.

The biggest problem I have with building some of the older circuits is parts availability. And I once had an electronics store. Tubes I have, sockets I don't. I have info on building an Ocean Hopper, but lack a source of the tuning capacitor. I do, however, have a repro front panel which I got from someone I read about in "CQ" several years ago.

Kids are still building stuff, just not as much.

I am mid 40's and still
remember being a kid.

Now I have kids.

These days the kids:

a) Have a lot more interesting things to choose to spend their
free time on.
b) A lot less free time.

Pete:

You really got everyone going on this one!

For starters, ask any new EE graduate the difference between a superhet and a TRF receiver and you will find out quickly that the new EEs don't have a clue how a radio works. The University of Texas at Austin recently changed the name of the EE department to Electrical and Computer Engineering. In the "good old days" Electrical Engineering and Radio Engineering were basically the same thing. Now it's computers and the Internet. Kiss radio goodbye!

The so-called Yuppie generation was brought up on television, a visual medium. Computers are largely a visual medium, so someone brought up on TV will follow right in to computers. Radio is an auditory medium and just doesn't seem to generate much interest with the under 50 crowd.

There are exceptions. Hopefully, you and others publishing on the subject will continue to provide vital information to keep the hobby going.

I am a member of the Texas Antique Radio Club and the average age of our membership is around 60 - 65. Our youngest active member is in his late 30s and we have several members in their 80s. Unfortunately, we have no female members. We are basically just a bunch of hairy-legged old farts. How about plugging a few of the Antique Radio Clubs in your column each month and help us bring in some younger (and female) members.

There's always the way that WILL work...a friend of mine was doing sound for a concert, and he found that suddenly the audio changed...upon checking his AC lines, he found that several high-wattage (1200 watts or so) hot dog cookers had been spliced into his power cables by some resourceful folk...cut through all layers of insulation, etc, and connected the cookers...now, to try THAT with an overhead power line...

From: rjburden@bigpond.com
Message-ID: <37c895e0.44024@news.bigpond.com>
Source record: 67583

Hi,

I have a problem with the buffer in my VFO (3.6MHz) which has me stumped - it is being pulled from frequency far too easily. I am using a simple two transistor buffer from Solid State Design (the bible!), copied in the attached gif.

Can any one suggest why this might be happenning? I didn't take a great deal of care in the selection of the transistors because I was under the impression that in this circuit configuration transistor parameters didn't matter.

I conciously avoided FETS because I was using what I had to hand. Perhaps an alternative configuration - cascode? differential? What rules of thumb are there regarding the isolation different buffer configurations have?

I have lots of questions, just no answers :)). Looking forward to your responses.

You were misinformed. Nobody gets life imprisonment in the US for much of anything short of murder, treason, or a very large inventory of illegal drugs. Theft without breaking and entering is never more than a misdemeanor.

>Justice is still only for the rich is it not?

Not here. The courts here in Athens County regularly appoint local attorneys to represent indigent defendents. I've watched it happen. If you come to visit the US, stop in and watch some court proceedings: except for juvenile cases, they're always open to the public and the press.

> The English judges send people to Australia in labour camps for steeling food.

That ended in 1860. Most European nations had penal colonies at that time.

>Well, I would not mind
>living there now, beautiful place. >But from this you can learn, better >'detune' your radio, or you may get the >chair. > >* When the house is >in session, no ones property and rights are safe *

Maybe that's the case in Europe, but not here in the US. Our legislators are citizens like everyone else, and they have to stand for re-election every other year. Again, you're welcome to visit our Capitol building and watch our House of Representatives and Senate in session. Thousands of people do so each year, and most sessions are televised as well.

Yawn. Why in the heck would you waste time with something like that?
Ever hear of an MC13155? Besides, nobody uses FSK anymore. Complete
waste of spectrum space with no process gain. Let us know when you have
achieved something useful in a contemporary sense, like maybe a 256-QPSK
modem, or (better yet) a correlated front end for an impulse-domain
receiver.

Strange, but a few days ago, I was doing immunity testing on a digital data link receiver; a nice A/D and then some hot dedicated computing. It stood up to CW fields like a champ. Then we turned on some pulse modulation, you know, like to simulate motor brush noise or an auto ignition. Funny thing happened. The ole digital magic really crapped out when we hit a PRR which was a subharmonic of the sampling rate. If that had been an analog superhet receiver, I doubt if there would have been more than just a little ticking at the detector, and an FM detector would have eliminated even that.

Sorry, I'm no digital design guru; I just get to screw them up.

I am wondering if anyone under the age of 50 is building radios anymore, or is the "magic" of building a one-tube regenerative receiver using a 30 or '99 tube reserved just for those of us with AARP membership. I am feeling kind of sad, because more than a few old timers have sent me the remains of their junkboxes because no one else is interested; and they didn't have the heart to take the stuff to the dump. (Nothing special, old sockets, resistors, coils, etc.)

Apparently, you haven't heard of the NORCAL QRP club. They meet every 1st Sunday following the Livermore Flea Market and there's always lots of projects being shown. Not much activity with tubes these days, but you can people building things from all kinds of technology, ranging things built out of complex ICs to the full transcievers built almost entiredly out of the lowly 2N2222, and yes, there was even a regen or two at the last two meetings i attended.

I am wondering, are we really the

Last American Dinosaurs

No, but it's not where mainstream amateur radio is at the moment. And it might be why we're way behind in certain area (like packet, for example). I do think some rethinking of homebrewing is in order, and we definitely need more non-HF projects if most incoming hams do not have HF privileges. Come up with projects for 6 meters and above, and you'll get more people involved in homebrewing.

:+> would make lower B+ voltage circuits essential, though.
:+>
:+> Just a thought,
:+> John H.

Speaking of that.

I remeber somewhere that someone had made plans that can fire Neon
Bulbs.

I believe you can still find drive buffers and isolation buffers to
fire something like the NE2H or NE2's with about 40~75 volts.

Or design RF projects that can use the Neon bulbs as a means to
indicate - with low-level RF strong enough to fire one of those bulbs.

I'll look thru my notes to see if I can find those old "Electronics"
handbooks. ;-)

No guarantees though...

--> Looked at from that perspective, no, it doesn't make much sense.
Building something yourself can teach you a whole lot about how those
off-the-shelf radios work, though. As a learning experience, it's useful.
And it feels good, too, at least to me. I assembled, a while back, a
'Neophyte Receiver.' This was described in QST around the mid-80's. It's
a two-chip design using an NE602 for the front end and detector and an
LM386 as the audio amp. Not exactly high-end performance, but putting
together a receiver yourself and then having it work is pretty neat.
In some ways this is a golden age for homebrewing -- I mean, you can get
half a radio on a chip! If you're designing something new, these kinds
of things can be great short-cuts. It's as if the inventor of the
gasoline engine had gone down to the local general store and found
spark plugs. ;)

--> Yes, but we still need tinkerers to provide us with new designs and
ideas. Your comments on off-the-shelf equipment being better neglects the
fact that all of that off-the-shelf equipment, at some point, existed only
in the mind of the person who invented it.

Incidentally, I'm not an old timer. I'm 22. I've also got an interest
in tube equipment, not for any practical value, but because it's often
beautifully constructed. It's interesting to see equipment where real
effort was put into making it look nice. That doesn't happen anymore.

I don't think so. The contention dates from well before urban myths. It
is probably a drafting defect in the law on conspiracy which, being
known, results in the law being applied sensibly. Yes, I believe it is
the element of secrecy which makes it an offence. There is clearly a
difference between 'secret' and 'undisclosed' which would occupy lawyers
for years.

So, it may be that a contract in plain words is not per se illegal, but
one written in code is illegal.

But if you're just trying to self-educate yourself, how are you going to learn how a VCO or mixer works by studying a block diagram? I'm trying to teach myself some electronics, and I've found that I learn a lot by building things I can "play with". It's kinda tough to change the way an IC works...

Hmmm, I'm not so convinced that there's a "more complete ... understanding" of physics -- it seems that they just keep postulating smaller and smaller particles to explain why their theories aren't accurate. I'm reminded of the old "it's turtles all the way down" joke.

I've heard that REAL HONEST-TO-GOODNESS MEN even ran metal 6L6s upside down in jugs of oil to squeeze extra Watts out of the poor things. Old wet socks slipped on the tubes was another quick and dirty trick, but required constant tending (put a dripper over it?). Then there was the CQ article about running 6AG7s at 1600V! Anybody got more abused tube stories?

I've had quite a bit of trouble with VFO pulling when the VFO is used for a transmitter running at the VFO frequency. The cause was found to be feedback from the transmitter final, in the form of large currents flowing on the ground plane. This problem can be minimized by being very careful in how you physically lay out the VFO tank circuit. The capacitor and inductor should be connected to each other, and the combination connected to ground at only one point. This prevents circulating currents from entering the tank and shifting the frequency. Physically separating the VFO and the rest of the transmitter is also helpful.

The best solution I've found to this problem is to run the oscillator at half the transmitter frequency and use a frequency doubler following the oscillator.

If the oscillator is being used only for a receiver or a heterodyning transmitter, this problem won't occur and something else is causing the problem.

Could I see the raw data on that statement please?Please, Please, Please do NOT *even* think to speak for me. I'll give you that regen receivers are infererior but boring is a state of mind that you seem to enjoy, not "everyone else". I'm 37 years old and I've got a masters in physics along with lesser degrees in math, EE, English, Military Science, and Fine Arts. I've been designing embedded computers and writeing operating systems for 12 years now and some of those computers have wireless componets in them. I have a good understanding of how to use modern radios but up to a few months ago I was as ignorant as a new engineer. (Every engineer that we hire finds two things on his desk on his first day, a resister color-code chart and a complete set of Forest Mimms project books from Radio Shack. Every one of them can write out the math equations for a feed back control circuit but not one of them could build one. It's sad when a person goes

to collage for 4 years for electronics and can't read a resister and doesn't know how to use a transitor.)

I say was ignorant because a few months ago I was cleaning out some old boxes and ran across some Gordon West code tapes that I had bought back in 1983. Even though I've been interested in ham radio since I was a teenager I never got licenced (my Elmer left suddenly and I had a car that needed "fixin'"). Three months ago when I found those tapes I got bitten by the bug again. This time I actually put the tapes in the tape player and started learning.

While learning code I decided to build a radio receiver so I could copy live code. I built a 5 tube super-het from an article I found in an 60's QST. I decided to use tubes because I had a bunch of them stored away from when I was 15 and I wanted to be entertained as well as to learn. Contrary to some people who seem to think that they can speak for an entire generation, tubes and hand wound coils are entertaining. After spending 20 years seeing electrons becoming more and more confined to "black boxes" it's fun to watch them "move".

Well, the radio didn't work and then I found I had no idea as to how to even begin trouble shooting it. I found that I was trying to stand on the shoulders of giants with no comprehension as to how they got to be giants. For all my vaunted education and experience I was ignorant. So I built a one tube regeny, it was simple, the theory was easy to understand and most importantly it worked.

I also built a transmitter (see my thread on this news group under "HELP Tube Guru advice needed.). It is a tube transmitter based on the 1625 using the 12BY7 for the oscilator-driver. Anyone interested in the circuit can find it in the 1967 Radio Amatuers Handbook, it is the Inexpensive 75-watter. With the help of some of the hams on this news group who know tubes and know how radio really works I will soon have it completely up and running too (Thanks Guys!).

I cannot begin to relate how much I've learned in the past few months about radio and how it works. I do know that I learned a lot more from that one tube regeny than I ever learned from that kit I got from Ramsey (it still doesn't work but with all I'm learning I'll fix it some day). Now that I understand how my transmitter works and how a regeny does what it does I'm ready to tackle my next radio. I built the Mate to the Mighty Midget (some of you people know what I'm talking about, if you do please read my next thread I'm planning on coming out with soon called "HELP More Tube Guru's needed") and I plan on learning a lot more. Maybe by the fall I'll be ready to tackle that 5-tube super-het, but I've got a lot more to learn. After I've mastered these fundamentals I fully intend to move on to transisters and IC, operating on the giga bands with tubes is not a good idea but when I get to that stage I'll know how I got there.

In short (which is how I should have keeped this) I'd like to say that it's okay to stand on the shoulders of giants with out knowing how the giants got there, just don't expect to ever become a giant one day

yourself, those that do not know there past, have no future. That's what tubes, and code, and sparkgaps, and the smell of high voltage ozone are all about. It has nothing to do with "reviveing dead technology". It has every thing to do with learning and building a foundation and *earning* the right to stand on those giants shoulders.

Correction ... I don't homebrew obsolete electronics.

> Really, what makes you smile, Carl?

Designing, simulating, implementing, and verifying something like
an FSK modem which performs within 1 dB of theoretical idea,
yet consists entirely of gates and has no multi-bit a/d or d/a
converters :-)

Designing a new radio architecture which outperforms the previous
one significantly, yet uses fewer discrete parts and costs less to
build :-)

Having my simulations agree within a dB or so of the measured
performance after the circuit's built and tested :-)

(starting to get the idea???)

Gee, you read a book on VCOs or mixers (or study the sections
in the ARRL's "Radio Amateur's Handbook." Once you understand
the funamentals, then you can look at those block diagrams and
begin to understand how they all work together in that chip to make
the subsystem that it implements work.

You don't need to "change the way an IC works" ... try gaining
enough of an understanding to be able to select one that does
what you want ... there are PLENTY to choose from.

I'm not talking about cosmology, the big bang, quarks, etc. I'm
talking
about the basic physical laws, science, and math which govern the
behavior of radio/electronics. We have a much more complete and
useful understanding of those than we did 30-40 years ago ...
unfortunately, many hams are stuck at the level of 30-40 years ago
when they passed their tests (which many consider to be "graduation
certificates") and closed the books to chase wallpaper and "operate."

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-31 00:00:00 UTC
From: yvon roy <soj@sympatico.ca>
Message-ID: <37CB4C34.D31B36C0@sympatico.ca>
Source record: 67389

Hi! What is the frequency of this VFO? Pulling might be due to the feedback method
of your buffer arrangement via R-14; It is better to have no feedback applied to the gate but rather apply it to the emitter of your first transistor. I have a citcuit for this kind of
buffering, 2 transistors capable to swing 1 volt P to P into 75 ohms or 50 ohms with a lightly reduced output; but it is good only to 10 Mhz. For higher frequencies, you might want to use an integrated circuit which has a high reverse isolation. Regards. Y. VE2AUC

Source record: 67390

Hi! Use a ground plane on the top surface of your board; dont operate with very high impedance circuit at the input because the circuit might become regenerative and may also osciilate. Use very short ground connections for the IC as well as the coils. Y. VE2AUC

It all depends where you hang out and who you hang out with. Take a look in the mag "Electric Radio" - all sorts of tube radio gear being built. Most of it is far beyond the one tube regen stage.

> If you want to see dozens of people

Lot of 6 6AG7 Tubes, poplular in old ham transmitters. Used, tested Good. 5 or the 6 are Jan (military standard). I think the old Heatkit AT1 used one of these and a couple of other old rigs did too. Lots of circuits in the 40s and 50s ARRL Handbook with them in it. $12.00 plus postage.

This is typically called "Load Pull", and shows up whenever you have a
transmitter around.

I have been told that load pull can still occur with a doubler, since
there is some feedback through a doubler.

From: af389@lafn.ORG
Message-ID: <37CBDAC7.33F11D16@lafn.org>
Source record: 67395

Hi,
Any TEK 485 scope owners out there?
Any 350 MHz or faster scope owners can help too.

What are you guys using for the HI Z 10MEG 350 MHZ or faster
probes? I need your help.

My probe grabber tips are just not holding onto wires.
Also, what is a good method to create a STABLE makeshift short ground
lead?

Did anyone figure how to make a socket to plug the probe into
on copper ugly board projects for hands free, short ground lead
operation?

The 485 SCOPE is a real sleep, fine scope....so handy!
It syncs on and displays local oscillators well above 400 mhz,
where SEEING waveshape is important and amplitude is NOT.

Thanks for any help.

73 Magazine had an interesting panadaptor article a few years ago (I need to look for the article and date). It described how to modify any portable HF receiver to sweep the 1st IF - it has to be HF of course - using a simple sweep ckt and looking at the X output and Y with any old scope.

The author uses a cheapo radio shack shortwave receiver to illustrate sweeping the LO.

Nifty and works great!

Joe

One tube regens? Yuck.

The Golden Age of Homebrewing is *now* - components are
available of unprecedented performance and sophistication,
and they're dirt cheap, too. Builders of today have options
folks in the past never did - witness that nifty DSP
transceiver in the September QST. Consider how much time,
money, effort and hassle it would take to duplicate its
DSP IF stage in analogue components...

"Magic" takes different forms. Like seeing the output from
my newly rewritten weather satellite program the other day,
with a more sophisticated AM detector than my old program
and LMS adaptive filtering for noise reduction. Gasp!

Builders are still around. Just because it isn't the kind
of radio *you* approve of doesn't mean it's not homebrew.

Tek makes a little connector which just fits the probe tip, and this is the best I've found for a stable connection to an ugly project. It can be soldered into place in the project. The part number of one of them is 013-0240-00 -- there may be different sizes these days. I suggest you go to http://www.tek.com/Measurement/accessories/index.html, select "Passive voltage probes", find a probe type that's similar to the one you have, and click "Accessories" underneath the probe number. This will get you a picture of available accessories, which includes the connector for some probe types. There's also a connector made from a bent piece of thin metal and with a separate center pin. These are best used on a PCB, since there's no way to keep the center pin aligned in an ugly project. You'll also find a couple of accessories which make ground connections easier. One is a plastic gizmo the probe tip plugs into and which has two sharp pins, one of which is spring loaded. Another is a spring which fits around the ground part of the probe tip. Not all of these are available for all probes.

You'd better hurry, though, before Tektronix completes its self-destruction.

If the shape of a 400 MHz waveform is important to you, you'll need a scope with bandwidth of 2 GHz or so to get even a fairly decent representation of it.

Hi OM,

As an EE with 41 (now going on 42) continuous years of earning my
living
in the electronics industry, and 44 years of ham radio enjoyment,
I heartily disagree!
My job has never been a "high stress numbers game", before or now.
To make this so, I have consciously avoided job "opportunities" that
involved higher level management or stressful, politically-oriented
jobs.
In other words, I stayed with technical work. I've never regretted it.
I still look forward to going to work in the morning, and I still use
daily
Ohm's Law and the other fundamentals I learned almost 4 decades ago,
while working with SMT devices and highly integrated analog and digital
circuit design. Contrary to what I have read occasionally, the
fundamentals of circuit design do not change, but the tools sure are a
lot better.
As I have stated here before, we are living now in a golden age for
ham radio homebrewing. Never has it been easier, or cheaper, to build
excellent performing receivers and transmitters, particularly for simple
modes like CW and FSK (the only two I use). Integrated devices have
made it easier to assemble functional circuits, not harder. Stuff that
I
throw together at home does not require anything but elementary
electronics
knowledge at the level of the ARRL Handbook or similar sources. But as
always, for those who do not have the interest and/or motivation to
learn,
most everything new is is impossible or "magic", or the realm of
"experts".
Lucky for me, I had no such preconceived opinions about electronics when
I got started at age 13.

73,
Don, W6JL

Why indeed? For fun, actually. Gosh, my logbooks continue to fill up with worldwide QSO's on AMTO, PACTOR and CW, the only three modes I use. And Baudot RTTY remains by far the most heavily-used of the keyboard modes, far ouststripping all the Clover, Pactor, Amtor, PSK31, GTOR, etc so far.

Not all of us care about spectrum utilization or "process gain". Even AM has a following these days, remember. What is essential for competitive electronics in industry has, for me, little to do with hobby enjoyment of same. Not the same goals, or rewards, for me.

other items to consider:

use a resistive load across the primary and secondary of transformers,
using 4.7K (10K max). this reduced Q but adds to stability. use plenty
of 0.1, 0.5, and 1uF bypassing caps (monolythic). PCB traces wherever
possible. you can also add brass shim stock as a physical shield between
gain stages. don;t use more than three mc1350 stages. the amp chain will
likely turn into an oscillator.

No prize here, perhaps you need to reread exactly what I wrote.
I think I did a chapter on a solid state HF transceiver for the
ARRL handbook in the seventies, and have several QST cover
plaques for articles on a six meter solid-state 6 meter rig, and
an early article on 2-meter frequency synthesis. That,
besides hundreds of other articles in QST, Ham Radio, 73,
Communications Quarterly, etc....

Methinks you are being rather presumptious in your opinions.

I have an old stereo with quite a hefty Transformer in it that I think I want to use as a basis for a power supply (accesories getting a bit much). Ive looked for a FAQ before and dont seem to find one. I have Several ARRL Handbooks, but I just wonder if anyone has a neat 30 - 50 amp 12v supply schematics available.

Im going to check the transformer spec first though. What Im looking for is

Crowbar (over/under)
Current Limit
Current halt (if short occur's)

Easily obtainable parts (Local shop called Radar electronics has a ton of 6000 - 8000 uf/pf 35 - 50v caps) and Scr's and VR's

Thanks

Rick KF7QZ

Is this really so? I seem to remember that the bandwidth went down roughly by the square root of the number of tuned circuits (depending on coupling, etc). I'll sure be looking this up when I get home!

Complete
> waste of spectrum space with no process gain.

Not when it's frequency-hopped ... besides, M-ary FSK is good for
weak signal ... as M increases, the required Eb/No decreases ...

> Let us know when you have
> achieved something useful in a contemporary sense, like maybe a
256-QPSK
> modem, or (better yet) a correlated front end for an impulse-domain

I believe you mean 256-QAM ... QPSK implies 4 phase states and doesn't
go with "256" ... and the ultra-wideband stuff that I believe you are
referring
to as "impulse-domain" isn't approved by the FCC.

> > Designing a new radio architecture which outperforms the previous

> Simulations? Yawn. Building:simulation :: sex:Playboy.

Simulation is a valuable design tool ... certainly better than "cut
and try and itterate." Modern designers don't build squat without
first simulating it.

> > (starting to get the idea???)
>
> Likewise, OM? :-)

Yea, I'm getting the idea that you "talks a good talk," but don't
actually
know how to "walk the walk" when it comes to actual design practices.
(I'll bet you can beep real fast, though ... :-)

Hi Guys,
heres the question. I need 80 amps at 14 volts for a Ten Tec solid State KW amp.
I don't want to buy their $800 supply.
Is it possible to hook up two 50 amp supplies in parrallel, possibly with a couple of 100 amp diodes in series with the postive lines to prevent power feeding back?
I know I can use a car battery, but I have the two supplies already.
What the consensus?
Thanks
Dave dothetime@hotmail.com

2361. Re: Help with VFO Buffer - load isolation needs improving - vfo+buffer.gif (1/1)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-31 00:00:00 UTC
From: Rocci <rocci@worldnet.att.net>
Message-ID: <37CC5E1D.6D996261@worldnet.att.net>
Source record: 67411

Feedback generally reduces the isolation of the amplifier to a factor not much larger than the closed loop gain. A much better topology for oscillator buffering is the common base configuration w/o feedback. You can achieve almost 60 dB of isolation at HF frwquencies. Once you have this much isolation, any significant load pulling will probably be due to transmitter output feeding back to the oscillator. When the Xmtr is keyed, a time delayed version of the oscillator frequency feeds back and mixes with the oscillator. This is results in a net phase shift, and the oscillator frequency changes to make the overall phase satisfy the conditions for oscillation with the fixed circuit components
Beware though, the CB amp has a very low input impedance, and a vey high output impedance. Otherwise, almost as easy as 'falling off a log'. 2N3904 or 2N2222 should work fine.

Maybe not *abuse*, but...

I seem to remember seeing a picture in a 1959 QST of an amplifier using something like 50 807s in parallel. (they were *cheap* in the 1950s!) The idea was to dispense with any kind of output matching circuit, by using enough tubes in parallel that the total plate impedance dropped to 50 ohms. I presume (hope!) that some kind of bandpass filter was used though! (would also love to see that power supply...)

Has anyone build a really high performance I+Q direct conversion
receiver and followed it with a high performance A/D and DSP?

I would think that a pair of high level mixers
followed by a 24 bit 96Khz stereo audio A/D converter and DSP would
give you an unbeatable receiver for the HF bands.

Has anyone done this?

What are the drawbacks?

Paul (KL7JG)

I've also been fascinated by this in recent years. There's some cool technology available that makes this not only feasable, but also makes the hardware very simple and eminently reproduceable. Any time you can trade in RF complexity for digital complexity, you generally get a cheaper and simpler product.
Problems I've struggled with are:
The mixers - How to build a pair of mixers whose gain (loss) and phase track over several octaves of RF and also give good intermod performance. My goal would be at least 50dB of unwanted sideband suppression, but this requires extraordinary amplitude and phase balance. I recently came across an article by Dan Tayloe on a 4-phase switching mixer that uses a single high speed bus multiplexer IC as a quadrature analog mixer. Dan posted measured intermod, blocking range, and noise performance that beats some of the best rigs on the market, yet the mixer is 'near digital' in implementation. It requires a 4x, 2-bit digital LO clock.
The RF phasing for the quadrature LO's (if required) - Most analog I/Q mixers require an accurate 90 deg phase shift network at the LO. This is a major source of phase mis-tracking over the wide HF range. New DDS technology from Analog Devices now makes it possible to generate numerically accurate quadrature RF signals up to 120 MHz. Only question mark is spectral purity.
The I & Q IF filters - Some filtering needs to be inserted in the I & Q outputs to prevent out of band signals from overloading the ADC. Since these filters are at audio, they need to have very good phase and amplitude tracking over nearly a decade of frequency.
AGC - This one make my gray matter smoke. Signal amplitude measurement is most commonly done on the post-filtered audio DSP output. This DSP output might be delayed many milli-seconds from the RF input that caused it. Consequently, the ADC input might be overloaded for a significant time before a measurable output from the DSP indicates that it is time to reduce the input signal. AGC has always been a problem for DC receivers, but it seems that it should be possible to build DSP algorithm that handles it effectively and smoothly.

I'd love to see a thread, or even a seperate group, for practitioners who'd like to work on this. The idea of a 'virtual project team' with contributions from a far flung group of expert hobbyists could yield a PC controlled "VolksRadio" that could rival anything the Japanese are making at a price we can all afford..

I'm in.

Yup ... 1 degree or better phase accuracy and 0.05 dB amplitude
balance ... tough specs. Virtually impossible to get without some
tweaking and then likely only over a narrow bandwidth.

This bodes in favor of converting to an IF, doing some filtering
(to improve intermod performance and eliminate aliasing problems),
then either do and I/Q mix to baseband and digitize or sub-sample
and derive the quadrature channel with a Hilbert transform.

I'd be interested in a copy or a source for a copy of this article.

The mixers will still introduce some amplitude inbalance (and probably
some phase mismatch, too) ... even with perfect quadrature LOs it'll
still be tough to get 50 dB over a wide range.

> The I & Q IF filters - Some filtering needs to be inserted in the I
& Q

Another thing that points to doing a single-ended conversion to IF,
doing analog bandlimiting, and using the sub-sample/Hilbert transform
routine.
That way you can do the majority of the filtering in DSP.

The delay is there and you're stuck with it ... audio-derived AGC
is not that effective ...

Mostly, the point I was trying to make with all the bogus technobabble
was that not many of us who _do_ build stuff can afford to throw rocks
at others for failing to advance the state of the art with every
project. If I mock someone for using a 12BE6 mixer instead of a Gilbert
cell in his radio project, you could turn around and mock me for using
FSK instead of M-ary Q-whatever modulation in mine.

IMHO it's better to refrain from criticizing others' homebrewing
preferences altogether, and save the flamage for more worthy causes.

I should have just said as much in the first place, I guess. :-)

Yikes. To make 8 ohms it must take more than 100 tubes?<g>! (and 807s aren't 25 cents a pop anymore!)

I wonder *how much* response at 1Hz?? Sure, they get rid of the output transformer, but they still need one hilatious (sp?) DC blocking capacitor... Even if they run the plates at DC ground, (and drive the cathodes negative) they have to have either a plate load choke or one humongous resistor.. (either way, that load is going to be passing a LOT of current!)

I was about to say the *high* frequency response must be pretty good until one thinks about all the stray capacity<g>!

The circa-1956 original TV transmitter was still working at WISC-TV when I left in 1990. It used what was basically a tube implementation of the modern stacked-devices audio amplifier circuit, set up to grid-modulate a 10KW Class C amplifier at 61.25MHz. The devices -- six 807s, driven by two 6146s... (ironically, the whole mess then drove a 25KW linear using seven tubes in parallel in a circular box resembling a large water heater.)

The point that I was trying to make is that too many hams
limit themselves (either because they are just into nostalgia,
because they don't know any better, because they haven't
kept up with technology at all, or because someone else told
them that "SMT is too hard to work with" or "ICs are too
hard to understand, build everything with discretes.") to
doing little beyond regurgitations of things that were old
decades ago.

I really believe that we HAVE to modernize both our
rules and our technology to survive. Right now, too many
hams are happy back in the 50s and 60s ... that's unhealthy
for a technical service such as the ARS. It neglects the
majority of our Basis and Purpose ... the reason ham radio
exists and has bands of frequencies to use.

> IMHO it's better to refrain from criticizing others' homebrewing
> preferences altogether, and save the flamage for more worthy causes.

I certainly think that prompting ... even prodding if necessary ...
hams to move forward towards today instead of snoozing
in the past is a worthy cause. (you snooze, you lose ... in this
case our bands, eventually if we remain stagnant.)

Even the ARRL has recognized this as a major problem facing
the ARS in the coming decade.

Yeh. I suppose you've been brought up to still believe that all electron
movement is at the speed of light, right?
Some reading in scalar physics will dispel that notion in a hurry.
Hans

With a modern CCD IR camera, I wouldn't think you'd need
much light, but here are two ideas anyway:

1 - US company called "cheaper than dirt", I think they have
a website, sells psuedo-military surplus gear, including IR
filters for flashlights and hand held spotlights, as well as
the searchlights themselves. A say "pseudo", because they
mostly carry commercial items. Other surplus places
probably carry these, as IR searchlights used to be popular
with various militaries.

2 - Build something out of one or more IR LED's. Most
electronic parts have them, just use a resistor to set the
current to a bit below max. These are brighter than you'd
think.

You're sucking me in, here.
But okay.
The taste.
You snidely mentioned about taste as well as eyesight.
So go read.
Read about what is being done with food.
Never mind the references to the weird stuff.
The site is huge, and has nearly everything.
I have repaired and watched an early RCA color tv, the one with a round crt
in it.
I don't care to banter.
The picture, especially in motion, is superior.
End of communication with Mr. Miles.
Hans

2378. Re: Direct Conversion DSP.....

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-01 00:00:00 UTC
From: Frederic Rible <frederic.rible@ercom.fr>
Message-ID: <37CCDED7.707A146F@ercom.fr>
Source record: 67339

I am working on a I/Q homebrew receiver with DDS and DSP.

Please check http://www.teaser.fr/~frible

Currently, I use this receiver for EME operation. Requirements
are not the same as fo HF radio : dynamic range does need to be
very high because every EME signals are received with similar
power levels.

About phase/amplitude balance, I do not think that it is a major
issue : I believe that it is possible to tweak by software with
a formula like this one :

```
tweak_I = a*I + b*Q
tweak_Q = c*I + d*Q
```

With some trigonometric valuation, (a,b,c,d) can be reduced
to only two coefficients (phase, amplitude) correction.

By listening to a RF generator on several frequencies, and use a
calibration software, you can build a coefficient table. This
table, with proper interpolation, will give coefficients
as a function of rx frequency.

I do not have implemented this yet, and, if I am false, please
let me know before I code in a dead end !

For diagram and source code, be patient : I need some
free time to publish useful informations !

73's Frederic F1OAT.

I get the idea, and that is fine. I even believe you, though I have little idea beyond a dim understanding of what you are talking about, technically speaking. I won't deny you your pleasure and satisfaction. Neither will I deny your work, amateur and professional, may have economic and social value at large. It probably does. Just don't attempt to deny me and others who are years behind you, by some combination of preference, talent, and training, our small happiness. Everyone doesn't have to be working on the same projects, with the same goals and methods, do they?

You mentioned relevance and value several times in this thread--Relevance to what? What sort of value? I commend your dedication to innovation and development of radio technology, I do. Clearly it is valuable to you, and such activity has much economic value as well. What I and some others value about hobby radio has little to do with new technology. I have no formal training

or education in engineering, RF or otherwise. Exploring and learning a little science and antique engineering, via technologies that are relatively simple and static, has ultimate value for me. Likewise, exploration of the social history of technology has supreme relevance to my work as a college teacher (of English composition, creative writing, and literature) and as a "literary" writer. Plus, I find it fun. Don't know quite why, don't care to know everything :) Forgive me, all, for even mentioning the term, but this thread rings a bit of the ceaseless CW debates. Can't we all just get along? I won't force CW and simple valve circuits on you, nor claim vague quasi-spiritual benefits accrue from them to all (though you will pardon me if I say that in some small ways both 'antiques' intimate to *me* the esoteric and sublime). What I keep forgetting is that it is a hobby *&%$-it, but for some it is also their actual profession, so that makes us somewhat like two Spaniards--a Catalan and a Castillian-- yelling at one another, each uncomprehending the other, claiming to know the only way to be Spanish.

That is still not the same thing as breadboarding a circuit (like a simple DC mono-band receiver, for ex.). You can visualize and conceptualize till you're blue in the face, but especially where fundamental principles or concepts are concerned, there are things only learned well and throughly where a strong element of experience/eperimentation is involved. I suppose that is why there are lab sections along with chemistry lectures, or why you build a prototype before your company invests in production of doohickey n.

That is right. A survey of the history of technology will demonstrate with frightening clarity how quickly the terms of the deal go from the machine serving people to people serving the machine. It has happened with every significant mechanical or electric/-onic device developed since the optical telescope. The good news is that we can find our own way out of this maze if we want to. I think it has to be an individual effort. I am trying, steadily simplifying my life discarding the trappings that don't hold true value.

Nostalgia, where it is active and thoughtful, isn't really nostlagia or 'retro' at all. For many of us, I see a keen interest in morse and simple, mainly valve technology as a technique in applying (self-medicating as it were) the method of escaping a future foisted upon us by taking the side-door out through the past. . .By reducing and simplifying our means, the *how* of our lives, we can clarify and have the real opportunity to choose the *what*--what we do, where we live, who is around us. For me, boatanchoring and CW-only (and 5% AM, that mostly 10- and 2-meter) is fun anyway, but shows me again and again how little I need, and how much of what I do with my life, how much of what I have is truly disposable. Take out the trash and have a nice life!

Ken,

Here are a couple of parts sources to get you started. These outfits have the added benefit of stocking quite a few books on radio--history and technical.

Name says it all: http://www.tubesandmore.com/

Air variables: http://www.cardwellcondenser.com/

Surplus goodies and parts: http://www.fairradio.com/

Tubes, sockets, etc.: http://www.electron-valve.com/

Coils: http://www.bwantennas.com/coilcat.htm

New and NOS parts, all types: http://www.oselectronics.com/index.htm

Transformers: http://www.pwdahl.com/

Crystals: http://www.icmfg.com/

Ferrites: http://www.bytemark.com/amidon/

A list of more sources: http://www.repairfaq.org/filipg/LINK F_mail_order4.html

New parts, a lot of hard to find types, cheap: http://www.fix.net/dans.html

Lots of amazing parts and surplus: http://www.surplussales.com/

You will definitely find the tuning cap and sockets you seek at *several* of these places. You'll also find a bunch of good books, esp. at AES and Ocean State. Most of these outfits still have print catalogs free for the asking (via email if you like). All of them have links to more sites, of course. Good luck, and happy homebrewing!

2384. Ref Osc problem in FT-726R/6m

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-01 00:00:00 UTC
From: Scott Townley <nx7u@primenet.com>
Message-ID: <37CD464A.15123182@primenet.com>
Source record: 67345
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

<Exposing ignorance>

The reference oscillator in my FT-726R 6m unit PLL circuit (if you care, 6.4MHz xtal osc w/ 2SC945P transistor driving a divide-by-64 CMOS chip) doesn't have enough voltage output to drive the divider. Known working modules generate roughly 3Vp-p into the divider; this one is generating 0.3Vp-p...not enough to trigger the CMOS gates.

The osc circuit is very simple, XTAL is series with a tuning cap and hanging off the base of the transistor; base biased with resistive divider; emitter (output) AC-coupled to divider and a 3.9kohm emitter feedback resistor to ground.

One other symptom is that the DC emitter voltage is significantly lower than specified/measured on a working unit (broken is 3.5V/3.9k for an Ic=0.9mA; correct is 4.9V/3.9k for an Ic=1.25mA). Collector and base voltages are spot-on (should be since the collector is the power supply bus rail and the base is just divided down from the collector...common-emitter configuration).

How would one increase the amplitude of the osc to the correct level? The freq is right...I've replaced the transistor on general principles but that changed nothing. Weak crystal?? Lower the emitter resistor value to get more Ic flowing?
<Covering up now>
Thanks in advance!

For me, part of it is a matter
of scale. Running me flingers
along the wires, I "see" where
that cap or diode does its job.
It's oddly like being a human
signal tracer... "Here i am,
AF, RF, yup, here's where the
DC bails,..." It may have to do
with (forgive me, Pestalozzi,)
"learning styles."

I can link-up tinker-toy blocks
of IC sub-units, but something
about it is not satisfying in
the same way. We all adapt to
the extent that we must, but I
feel the same vague unease when
grabbing a chunk of code from
a software library.

Look in the handbook in the late 80's or so for a ps that used 3055's in the output. Seems like they used 4 or 5 of them, but had enough drive and control stuff to add to really easy. I think that one used a darlington pair to drive the base of the series pass array, with a motorola single chip doing duty as the sense/drive for the darlington. They also did a nice job of descirbing the current balance and drive requirments along with the issues of thermal conduction and voltage drop.

.

> Vacuum tubes also exhibit a transfer speed in excess of 80 times that of a
> semi-conductor.
>

Ummmmmm..... Don't get me wrong, I agree with a lot of what you said, or at least what I think you said. But having done my masters paper on the break down of magnetic domains in high saturation metels under large EM pulses I had to work a lot with solid state theory and k-space transfer. Just exactly what to you mean by "80 times" "transfer rate"? Whether your talking about electron transfer in the valance band or end point emmision you've still got electrons traveling at about 70 times the speed of light. Now I realize that differences in packet speed and particle speed can boost transfer to over 1.6 times the speed of light (free space) but I have a problem with 70 times SofL. Now if you are refering to "Hot Electron" theory then your transfer gain can be increased due to the "excitation pool" but only by a few femto seconds when compared to most semi conductors. This still leaves you far short of "80 times". As I said, I may be missing what you are refering too. If so, could you elaberate on the theory?
Rick

{lot's of good stuff from Will snipped}

Thank's Will, you've put into words pretty much how I feel. I've been designing embbeded computers for 12 years now but I am a novice when it comes to radio (in fact I'm still waiting for my novice licence to come from the FCC). Why novice and not technician? I prefere to work code. No "nastalga" here, I just prefer code. I'm teaching myself by building tube receivers and transmitters (and asking a lot of questions on this NG). I work all day with ICs. CPUs, DSPs, ADs, DAs, DSS, 74s and 40s, Switchers and Mixers, bandanglers and ventuslers. If it's got letters instead of a name, I know how it works and I can program it.

So why work with tubes? Well besides the fact that I had a lot of them laying around from when I was a kid I like the simplicity of tubes and the fact that I can see the electrons "move". I am not at a point where I can design a packet xcvr yet, I need to build my fundamental knowlege and skills. When I looked into building my own stuff I tried both solid state and hollow state. Tubes offered, for me, an easier to understand approach with a more "hands on" feel. Any one who say's you cannot learn from "obsolete" technology has obviously never felt the thrill of hearing code coming out of a simple one tube regeny that you built yourself for the first time. My regeny didn't work at first and I had to dig into the theory and specs on the tube and the circuit, with a lot of study and even more help from the guys on this NG (they are helping with my transmitter, very relevant to how the RX works). I was able to experience that thrill a week ago. I could have taken the solid state approach and probably would have learned as much, but maybe not.

Some day after I've learned a lot more and worked for my General Class licence I just might build that Packet tranceiver. Will I build it from tubes? Probably not, but what a challange it would be. And I should hope that I don't have a self appointed techno-task master berating me for my choice of technologies. After all, it is my choice.

I'm pretty sure that's what the Rockwell/Collins 95S-1 does
(http://www.collins.rockwell.com/government-systems/products/pdfs/comm/95s.pdf).
It doesn't even attempt to guarantee good I/Q phasing across its
synthesizer's 2 GHz operating range, but it does apply mathematical
compensation in the DSP, with excellent results. It'd be interesting if
the quadrature correction technique (which is undocumented in the 95S-1
manual) really does turn out to be as simple as that!

It's theoretically sufficient to use linear combinations of the
proto-I and proto-Q signals, and it's probably sufficient to do
so in practice too.

S53MV's zero-IF/Weaver radios do an analogue version of this.

Hmmm...

Source record: 67353

Okay, it's been a while since I posted any results but I've been busy. Also after spending an hour here and a couple of hour there on the transmitter I had thought that I was on my way to figuring it all out. I was at the point were, after trimming the tuning coil and working out the kinks with the loading and tuning caps that I was able to get about 25-30 watts (@20 watts on 40 meters) out to my dummy load. Then one night just for the heck of it decided to get the best responce dialed in using the dummy and then switch back to the light bulb and see what happend. The results were quite spectacular, The light burned as bright as any 100 watt light and the meter was pegged (100 watt pyrimid meter). Well needless to say this got me thinking about what one of the posters (I think it was Jim) who said something about overdriving the input of the 1625. When trying to get the most output to the dummy load I had routinely been turning the drive capaciter up to get those 25 watts. So I looked at the output of the driver on the built in meter and saw that I was driving about 8 mA out to the 1625. Just on a wild guess I'd say that that was too much. So I left the light bulb plugged in and retuned by the instructions with the bulb instead of the dummy. Using 3 mA drive and tuning for best dip I was getting about 80 watts on my meter and measuring the voltage at the antenna I was seeing about 850v pp. Another guess but I'd say this was too high for a rig rated at 75watts input. After thinking about it I came up with the idea that even though the light bulb was inaccurate in its loading effects, the dummy and/or my watt meter where also likly flawed. I was showing way too much with the bulb but way to little with the dummy. So I decided to build a new dummy based on a different design and use a watt meter barrowed from the local University. Well, even the best laid plans of mice and men go astray. Last night when I sat down to work out the relevant parameters as far as watts at dummy and bulb vs voltage output vs driver current and such the transmitter started acting strangly. Watts out started falling off and I could swear I heard a metalic "BING" noise coming from somewhere. Performance continued to fall off untill I got nothing at all. I tried changing out the 1625 and the 12BY7 and the OC3 and OD3 VR tubes but nothing help. At present this is what I'm seeing.

1) I still get the driver current from the 12BY7 to work correctly so I know I'm driving the 1625.

2) When I switch from TUNE to OP the OC3 tube stops glowing. The OD3 and the OC3 are in series with each other with the OD3 being grounded. When the mode switch is in the TUNE position I get 270v out of the OD3, which drives the 12BY7 and 375v out of the OC3 which drives the 1625. When I switch to OP I get 440v out of the OD3 and 450v out of the OC3.

3) If I key the circuit when I have the mode switch in the OP position the OC3 will start to glow again and the volages fall off to a little below the

TUNE posision readings.Switching to the 1625 plate reading on the internal meter shows that I'm getting about 120mA from the plate but no amount of fiddling with the tuning or load caps causes any effect, let alone a "dip" of any kind.

Okay guys, what did I do now. I'm going to look at it all tonight, maybe just a short or open line somewhere?

Thanks for the help.

Rick

--> It works both ways. Modern conveniences become necessities if you let
them, it's true. But that isn't necessarily a consequence of their design.

Technologies, I think, tend to go through four stages. Stage 1 is when
it's experimental and hardly works. For cars, this would be the very
early horseless carriages that were basically toys for the rich. Stage 2
is when the technology works reasonably well, but with a lot of effort.
For cars, this would be the Model T stage of development -- reasonably
reliable transportation, but you had to fix it often, hand crank it, and
adjust your own mixture and spark advance. Stage 3 is when the technology
reaches the point where it mostly takes care of itself, freeing the user
from many of the details. Cars probably reached that point in the 50's
or so, and have been being incrementally refined in this area ever since.
Stage 4 usually overlaps with 3, and is when unnecessary frills start being
added. A modern luxury SUV with shift-on-the-fly 4WD, active suspension,
power everything, and a 6-CD changer is a good example of Stage 4.

Personally, given the choice, I prefer to stick with stuff from Stage 3.
Cars I can fix in my driveway, radios that still came with schematics,
those kinds of things.

I have several Radio Shack business band radios model BTX-120.
The battery packs are just like the ham rig HTX-202 and 404, and
also the Icom 2AT. The packs are 8.4 volt.

Does anyone know if this radio can handle up to 12 volts?

The BTX-120 is like the 121, 122 and 123 also.

Tim

Oh, alright, then.
You are using the speed of light as a base. and multiplying that.
You think that the speed of energy in magnetic circuits and solid state devices is happening at the speed of light constant, which is just not so.

The energy/effect transfer in a vacuum tube is closer to the speed of light, and really we should say that the transfer is 70 times slower in solid state.

There is, in quantum physics a hint, and scalar physics, an intriguing effect where the "projectile" strikes the target halfway across the universe, just BEFORE the projectile leaves the source.

Now thes peed of light, as you know, has been assigned a constant value.
Is it accurate and precise?
Under all circumstances?
No? Then it is not absolute.
Furthermore, what is light? Just what we can see, or the entire electromagnetic spectrum?

It has been assigned to the latter rather arbitrarily.
You can do the math to see that a sound wave travels slower than a radio wave which travels slower than infra-red light, which travels slower than cosmic rays and so on BEYOND the energies listed.

Light traveling through a medium will have a different velocity than that of light traveling through a different medium.
Same thing all the way down the scale to sound waves, and up the scale to gravity waves which are faster travelers than light or electrons.

Holy Hotfoot, Batman! Those are some bizarre numbers, Rick! First off, the Wattmeter is designed for a given impedance, which the lightbulb no doubt does not come close to matching. That extremely high output voltage (850 P-P) also indicates a load very far from 50+j0.

Regarding the grid current, 8 mA is way high for a 1625, and will probably harm the tube. The 3 mA figure is a good one to use.

Now, about those VR tube voltages...very strange! There's no way I can imagine that you can get a voltage higher than the VR tube design voltage, assuming good tubes. Are you sure the 0D3 cathode is at ground? You should always get 150V across that tube. If the voltage is less it's because you're drawing too much current through the dropping resistor (the tube needs about 5 mA minimum through it). If the voltage is more than 150 something is very very wrong (bad or wrong tube, wrong meter scale, not really measuring voltage across the tube, RF getting into meter, ...?). The voltage on the cathode of the 0C3 should be the same as at the plate of the 0D3, and the voltage at the plate of the 0C3 should be about 255 (150 + 105). Since both voltages rise when you reduce the load, it really sounds like your 0D3 or related wiring is bad or wrong. Be sure your design current through the VR tubes is within limits (30 mA max). Don't assume anything at this point -- measure the voltages at each VR pin (first with the 12BY7 and 1625 removed) to confirm that things are right. Then see what happens when you put the other tubes back in (12BY7 first, then 1625).

That's about all I can think of at the moment. Be interesting to hear what you find.

73,
Mike, KK6GM

Ahh..... no. I've done enough k-space calculations to know that electron or energy transfers do not take place at the speed of light.

>

I'm really going to have to see the numbers on this. I'll do the calculations for the transfer speeds for a standard doped NPN transister substrait if you'll do the calculations for the vacuum tube. By which I mean I'll do the electron transfer rate in the valance band. Then we can compare math and numbers.

> There is, in quantum physics a hint, and scalar physics, an intriguing effect where

Are you talking about Bell's theorum? The jury is still out on that. While getting my masters in physics, I had a mentor, Dr. George Duffy, who was heavily involved with Bell's theorum and published several papers on it. Besides, that theorum or any other really has nothing to do with calculating electron transfer rates in semiconductors or tubes.

> Now thes peed of light, as you know, has been assigned a constant value.

If you are refering to the Heisenberg uncertainty principle then of course precise measurment can never be obtained.

Hmmmmm..... Yes it is an absolute if you assume free space and the engineering view that at some point you have to accept your numbers and use them.

This is only true for EM waves traveling in some medium and not free space. When traveling in free space all EM waves regardless of wavelength travel at C.

> Light traveling through a medium will have a different velocity than that of light
> traveling through a different medium.

True

> Same thing all the way down the scale to sound waves, and up the scale to gravity
> waves which are faster travelers than light or electrons.
>

I'm not sure what you are trying to say here. Sound waves are not EM in origin and there for you cannot compare thier propagation to EM or, if you prefer, light waves. The same holds true for gravity waves. They are not EM in origin either and as for the rate of propagation there is much debate by Roseburg, Wheeler, Thorn and others as to whether gravity waves propagate at all or if they exist within the frame work of the universe as part of the so called "frabric". In effect sound and gravity do not exist on the same "scale" as you put it.

As for electrons they enjoy the benifit of the duality. Are they particles or are they waves. The answere is, of course, both. An electron as a paticle can stand perfectly still as Millikin's oil drop shows. When electrons are accelerated as they are in a cyclotron they will show wave like properties but of course they can never get away from there particle nature as (if I am not mistaken) m=mo/(1-v^2/c^2)^1/2. As you can see, as v approches c, mass approches infinity. And in fact any one involved with electron acceleration in a cyclotron can tell you that as the elctrons approach @ 1/10 c they must begin to take the extra mass into account and increase the B field to the Dees to compensate not just for the velocity but for the mass increase as well. So again as you can see electrons cannot be treeted like EM waves and therefor they too do not excist on the same "scale".

However this does bring me back to my original observation. I really need to see the math as to how energy transfer within a tube is 80 times faster than in a semi conductor. Just so there is no ambiguity here I'm going to calculate the time it takes for electron flow to start out one end of a semi conductor (doped silicon) when an EMF is applied to the other end. That will be my "speed of emission" for lack of a better term. You can calculate the "speed of emission" for a tube then we'll compare math and see if energy transfer is really 80 times faster. Is this what you have in mind for energy/effect transfer or where you thinking of something else?

20 years ago at CSVHF in Oklahoma there was a talk of putting an appropriate length of pipe tightly around the anode of a 4CX250, filling it with water and simply letting it boil out for cooling. Worked. The EIMAC crowd there was impressed!

A short but important P.S. here. I bought my 1625 and some other tubes from I *thought* Tubes and More or Antique Radio Supply out of I beleive Tempe Arizona. That was incorrect. I have since thrown away all the paper work but I bought them from a guy named Dave in I think New Hampshire or Vermont. He has a little tube buisness up there and he has a web page. I can't think of his buisness's name and I didn't bookmark his website but he was very helpful in getting me the tubes I needed and at a good price AND I owe him $9. I'd really like to get that money to him and I need to order more tubes. Does any one know who I'm talking about and can any one get me an address or web site? Many thanks to any one who can help.

Rick

I really can't do the math anymore.I would look at a near vacuum, the charge attraction, and thermionic properties.
A vacuum would seem to be, under these circumstances, a clear path.
Any SEMIconductor would have resistive and capacitive properties causing a delay effect, I imagine.
Sort of like a luminance delay in television? It is needed because the chroma signals would not align with the b/w image due to delay.

That's true except it was used to show that there are more things possible than the layman would assume. I'm glad you have had the interest to pursue these things.Try to look for how it could work.
Try to find what the limiting factors are in mundane calculus.
Again off-topic, but the attractive force leading to acceleration is greater between a large mass and a constant, than a small mass and a constant.
This is only to show that the old line of thought and the usual formulae will always yield the confirmation they were designed for.

If you are referring to the Heisenberg uncertainty principle then of course precise

> measurment can never be obtained.

But I mean further to point out that there is a difference in propagation between various wavelengths, which appears to refuted below.

>
>

> > No? Then it is not absolute.
>
> Hmmmmm..... Yes it is an absolute if you assume free space and the engineering view
> that at some point you have to accept your numbers and use them.

So let's assume something else, and assign values which pertain specifically to each entity being considered.Constants have to be watched. And I think that possibly you might discover the key in the area of new technology, if you can differentiate between light and 'light', light and supersonics, the latter of which is both propagated physically and electromagnetically.
Just put a piece of wire on your signal generator, and approach your hearing high threshold.
There is a window in which you will hear the wire, without a sonic transducer.
But enfin.

This is only true for EM waves traveling in some medium and not free space. When

> traveling in free space all EM waves regardless of wavelength travel at C.

Check this out. In the entire known spectrum of wavelengths, at what clearly defined point does a radio wave become a sound wave?

>
>
> > Light traveling through a medium will have a different velocity than that of light
> > traveling through a different medium.
>
> True

So the same signal traveling through the vacuum of a tube, travels what- faster than through a semi-conductor?A superconductor, yes. The speed may well be higher.

I'm not sure what you are trying to say here. Sound waves are not EM in origin

Okay. I wind a huge coil with an impedance of four to eight Ohms.
I hook it up to a hundred Watt amplifier, and run 800 Hertz.
There is no vibration permitted.
Yet it WILL emit magnetic waves which you do not hear.
A tuned ELF RF circuit will detect this.
These waves travel at light speed?
Or does the EFFECT travel at light speed?
Or does the signature?
Start cranking up the frequency, and go all the way up the spectrum to visible light and beyond.
It has to be a really good amp to do this, and of course impedance matching.
Again at which point is sound not a radio wave.

and

> there for you cannot compare thier propagation to EM

I just did. Sound and EME are not mutually exclusive.

> or, if you prefer, light waves.

Same thing, almost.

> The same holds true for gravity waves. They are not EM in origin either

And here is the crux for deep thinking, imagination, and hard work.Break this taboo, or rather, find the conversion factor between gravity and magnetism.
You'll have the World and Solar System to do with as you please.
Inherent in the relationship between gravity and magnetism, you'll find time variations, which is also nothing to do with tubes, but perhaps the whole thing should be looked at in order to develop a conceptual basis for hypotheses.

> and as for the
> rate of propagation there is much debate by Roseburg, Wheeler, Thorn and others as to
> whether gravity waves propagate at all or if they exist within the frame work of the
> universe as part of the so called "frabric".

I believe that they exist mostly within the bath or fabric. The principles can be legally skewed somewhat to facilitate what some people refer to as free energy and/or cold F.

> In effect sound and gravity do not exist
> on the same "scale" as you put it.

All energy is convertible, and therefore connected somehow. Whether the scale needs modification, or the interpretation of the scale requires adjustment, doesn't matter.You shall find the flaws and correct them.
If I dip my brush into the same paint can all the time, my paintings will be very monotonous, and not progressive.
Just look at the transistor! What a development. How radically different it is, compared to the electron valve.
And yet . . .
Some principles in operation are very similar, if not apparently identical.
You KNOW that new formulae had to be developed to account for the differences inherent in the two examples.
Apply that knowledge to all other areas of knowledge, and adapt the formulae to fit the facts.

>

> not excist on the same "scale".

A bit deep, but what about the "spin" between widely separate neutron or electron pairs?Millions of miles apart, yet one knows the other. So there is more depth to nucleonics than merely particles and waves.
As for the mass increase, that is just another form of time conversion, and may be fudging,

to protect the constant.
Hey, if we lose our constant of time, everything goes wide open.
Most scientists cannot stand that.
But they must adapt to natural phenomena.
Here is another wild statement from me, but true nevertheless.
"The speed of light is changing."
I read on the Net coming from scientists, that time is slowing down. I'm not sure if I got it the right way around, but there it is.
Gravitational constant is also changing.

>

> energy/effect transfer or where you thinking of something else?

It is definitely what I had in mind.But the math, I would have to study for a year to bring it all back. I won't use incomplete bits and pieces if do calculations, and some of these calculations won't follow accepted standards.
So it is better left to you youngsters to find a way to make my statement true.

By the way, there is a perspective which would be called cheating by some, but in that perspective you enter three-dimensional mathematics.

You would have three ninety-degree angles within a circle.
So 270 degrees instead of 360.

One divided by zero equals one.
Zero divided by one equals zero.

When a mass unchanging approaches the speed of light, it begins to curve sharply at ninety degrees into the time line.

Consider the superstring theory, bosons, and singularities.
I am sharing this with a scalar physicist, address above, since you share with homebrew, okay?
Feel free to contact Zeropoint.
Find out about the Grand Unification of Everything Theory.

A few weeks ago I went to an antique farm equipment show. Fascinating. There were lots of old (c. 1900) gasoline engines which used this cooling method. The cylinder was simply in the middle of an open-top pot of water which steamed away. (These "hit and miss" engines don't produce a lot of heat when lightly loaded, since they only fire often enough to keep the flywheel speed up. I timed one at one hit every 20 seconds.)

Many moons ago there was an article in QST or Ham Radio describing a cooling system for large tubes where water was dripped or sprayed on the heat sink. The idea was to regulate the temperature at or just above the boiling point of water. Boiling water takes a lot of heat, so this should be pretty effective.

Yip. Color is a whole lot slower than black-and-white. They got black-and-white photography goin' in the late 1800's, but color didn't really catch up 'til the '30's or so. Same with TV. As I r'call.

Good thing they didn't have the delay thing figgered out back then, though, or we woulda hadta wait fer the color b'fore we got anythin' at all. Then we woulda missed all them Chaplin movies. To say nothin' of Dr. Strangelove.

Read Part 97.1 "Basis and Purpose" ... that expands on what's
expected of us (and what's used as justification for our having
billions of dollars worth of spectrum at our disposal for free).
You'll find that the majority of that section is technically-based.

> small happiness.

Nobody's trying to deny you happiness ... just trying to encourage
you to realize it's not 1930-50 and "get with it" on some up-to-date
stuff (for your own good and the good of the ARS).

> Everyone doesn't have to be working on the same projects,
> with the same goals and methods, do they?

No, but endless regurgitations of the projects of the 30s-50s
don't serve a very useful purpose. They result in inferior equipment
and don't teach much in the way of skills/knowledge which are truly
useful in today's world.

> You mentioned relevance and value several times in this
thread--Relevance to
> what? What sort of value?

Relevance and value in reference to the world we live in today. Only
a nostalgic "collectables value" makes old tube gear worth more than
a (very low) per pound scrap value. That's an intangible "value" that
is not going to impress the regulators ... particularly compared to
the
billions of dollars they could raise by auctioning off our spectrum.
However, the tangible value of people who understand and can use
modern technology to provide USEFUL voluntary communications
in times of need (and can/do build the infrastructrue necessary to do
```

that) WILL impress them.

> I commend your dedication to innovation and
> development of radio technology, I do. Clearly it is valuable to
you, and such

training
> or education in engineering, RF or otherwise. Exploring and learning
a little
> science and antique engineering, via technologies that are
relatively simple
> and static, has ultimate value for me.

But can't you see that learning "antique engineering" is like learning
how to make fire with 2 sticks compared to today's technology?

I understand that you have no formal training or education in
engineering.
Guess what, neither do I to speak of ... I went to college at 16 and
attended
for 1-1/2 years until my Dad died when I was 18 ... I never was able
to finish
college ... but I've worked as an RF engineer for over 27 years now
... totally
self-taught. I've even taught college level courses in electronics.
(credentialed
in CA in the 80s on the basis of knowledge and experience which the
Board
of Education considered "at least equivalent to a Master's Degree")
I've
worked for or consulted for some of the most prestigious companies and
institutions in my field.

PLEASE UNDERSTAND that I'm NOT saying these things to "toot my
own horn" ... just to drive home the value and practicality of
self-education
and to encourage you to not settle for "only building simple old
stuff"
because you think it's somehow easier or that it's beyond your
capability
to design and build something more modern.

>Likewise, exploration of the social
> history of technology has supreme relevance to my work as a college
teacher
> (of English composition, creative writing, and literature) and as a

know
> everything :) Forgive me, all, for even mentioning the term, but

this thread
> rings a bit of the ceaseless CW debates. Can't we all just get
along?

I'm not trying to fight with you ... just to state the *serious* need
for
modernization in the ARS in terms of technology. Too many people
are stagnated in the past. If you find it fun to build/operate an old
one-tube radio, I have no problem with that. What I have a problem
with there being such a large body of hams who claim that's all there
is and all one needs to know.

> I won't
> force CW and simple valve circuits on you, nor claim vague
quasi-spiritual
> benefits accrue from them to all

I appreciate that statement.

>(though you will pardon me if I say that in
> some small ways both 'antiques' intimate to *me* the esoteric and
sublime).

Whatever "blows air up your skirt" as they say ... but I still
encourage you
(and everyone else) to broaden your horizons into more modern things
as well.

> What I keep forgetting is that it is a hobby *&%$-it,

Actually, it's defined as a service ... NOWHERE in the enabling
regulations are the words "hobby" of "fun" mentioned once. That's
not to say that it can't or shouldn't be fun. Of course it can or
few would become involved. However, it's PRIMARY intent
(government's reason for giving us all that valuable spectrum for
free) is self-education and training to maintain a pool of people with
USEFUL communications knowledge and skills ... and useful must
be continuously redefined in terms of comtemporary technology
and communcations methods in order to truly meet that public
interest aspect ... it's almost 2000, not 1930-50, and the
government and emergency services folks no longer need or
want a corps of telegraphers ... they need/want people who
understand and can provide modern communications services
when their normal means of communications go down.
We HAVE to keep up with the times or we'll become
worthless. Unfortunately, we're not keeping up, but
falling further and futher behind. Even the ARRL has
finally realized this and is grappling with how to go about
doing something about it ...

> but for some it is also their actual profession,

Yea, it's great getting paid very well for doing something I
enjoy enough that I do it for free for fun at home, too :-)
(I've been likened to "a mailman who takes a nice long walk
on his day off." :-)

> so that makes us somewhat like two Spaniards--a
> Catalan and a Castillian-- yelling at one another, each
uncomprehending the
> other, claiming to know the only way to be Spanish.

My wife is from Mexico ... she claims that people from Spain
(and other places ... Argentina in particular) "speak Spanish
with funny accents." :-)

Seiously though, all of my coments are intended to stimulate some
thought, awareness of the need for modernization, and to, hopefully,
prompt some folks to "think out of the box" and try some stuff that
they may have lacked the confidence to try to learn before.

73,

>
> Oliver

Let's say you have a .ckt file that you want to add a .flp data set (or an .s2p data set) from the ARD data bank (or from any other location in your computer).

Shrink the ARD window to an icon.

Search the data bank and find the data set that you want to import into your .ckt file.

Use the mouse to "select" the data that you want to use, and "copy" it.

"Maximize" the ARD window and then "paste" the data at the location where you want it.

2416. Good resources for learning electronics?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-01 00:00:00 UTC
From: Luke Seubert <lseubert@radix.net>
Message-ID: <37CDF07E.A1481F7E@radix.net>
Source record: 67377

Good day.

What are some good resources for learning electronics? I recently set up a new shortwave listening rig, and would like to build some of the simple circuits for little projects here and there - you know - those great little Arnie Coro projects.

As a youngster, I built a few Heathkits, and took the Heathkit DC electronics course, but have forgotten much of that.

Would folks on this group recommend going back to those Heathkit courses as a good means of learning electronics and pursuing the hobby once more? Any other good books or self-study courses out there?

Many thanks,
Luke Seubert

You presume to know what is best for me? Why? That's even funny! You do take what I pursue as a hobby *very* seriously indeed! I entered the ARS (got a ticket) after futzing around with BA recievers as a SWL for years. That's why I got a ticket--so I could futz around with BA transmitters, too, and "beep" back. I am uninterested in new circuits and materials et al. Totally. Had a few late-model radios, still have one, they're OK, <yawn>. I strive in all things for impracticality. You might try it. Yes, it is 1999, so what? If I can't play with My SX-28 and tinker with Grammer and Jones glowbug designs, then I forbid you to eat Baked Alaska, or any other dish that was concocted before 1990! I think the ARS can do without my technical innovation, wouldn't you agree? Obviously, you must, since my technical judgement is so lacking, as you have pointed out

>

Useful? Useful to who? To me, a Drake R-4B is about the upper limit of what I consider useful in a radio. I don't do any of this because I need to communicate. The old Basis & Purpose argument wont work on me, not at least as far as "advancing the radio art" goes. I think that section in Part 97 ought to be stricken. It's about time, speaking of anachronisms. I refuse to be useful to you, or anyway to your notion of what the ARS and the wide world need done. So, 30, 40, or 50 year old radios and circuits are plenty useful to me. God, save me from any more efficiency!

Clearly we have a gulf between us--HF over here and VHF+ over there. You are quite right to be concerned about spectrum auctions at VHF+. Not so at HF, clearly not at all. I suppose you beleive all hams should be burning the midnight oil in basement labs in search of those VHF+ circuits and techniques which will wow the FCC into not proceeding with further auctions? And we should all be using those bands all the time, even when the propagation and the culture bores us, to demonstrate the bands are needed and used? What I think OM, is that the bird endangered is the ham/pro-engineer who lives above 144 MHz. Us glowbuggers and QRQ guys may be old-fashioned, but it aint our acre LEOs et al are after, is it?

Sure, but as a backpacker known to take 10 day and longer trips 100 miles from even a fire road, I can tell you just how valuable knowing how to get fire out of sticks or rocks can be. When will you get it (and it is obviously not just me singing this song): pragmatism, efficiency and such are out of mind for some hams where the hobby is concerned. That is not why we do it.

And it goes on and on and on (snip snip snip) like that, always back to the same disconnect: we are licensed by the same government authority and often keep company with RF. That is about the extent of what we have in common, in terms of ham radio. Don't change, really, don't, and I promise, I won't either.

Not wanting to join in the general fray, but man, that's one heck of a visual. I'm trying to picture some 21st Cent. Desert Warrior carefully loading his tube regen packet radio into his pack prior to evacuating post haste in a sandstorm. Tube packet : two paper cups connected by a billion dollar string. Why not just teach your camel to rollerskate? ;-)

ROTFLMAO! ;-)

Sorry, man, something about that concept just really, really struck a funny bone. No offense meant, if you want one, then I certainly hope you enjoy it. Good luck.

I just saw an audio amp today, made the same way. They want $20k per
channel.
Obviously made for silly audiophiles.. They say it's got response down to
1Hz, but I really wonder just how much you are gaining here.

Yes.
I remember the good old days, and have hung on to them.
I also explore these great new days.
What I have noticed, is that information was more readily available on the Internet three years ago, in certain specialized areas.
I have also noticed, that control is being removed from the user.

You get up, you go to work, you go home, go to bed.

Then you pay your bills, and buy some throwaway "fun".
Comes the depression, us old dinosaurs :) will still be having fun, and be capable in the real world anytime anywhere, with stuff that's lying about.

So we have the best of both the real world, and the 'real' world as it is perceived by the money-pumpers.
A man never finds time for anything, he must make time.

And another thing.
The technology we use today, has flaws. Go way back to George Maxwell and check. Go back to to those great thinking philosophers which are still being revered today as infallible, and check.

Now piddling around with antique parts and technology is refreshing, when you catch the errors.
Let's use old tech with modern parts? Or remanufacture old components with today's expertise.
Let me tell you, there is a LOT of technology which has been restricted from today's textbooks.
Also, the old technology has not been completely researched due to the manufacturing processes of its time.
Vacuum tubes still have an advantage over EMP-sensitive solid-state materiel.
Vacuum tubes also exhibit a transfer speed in excess of 80 times that of a semi-conductor.
Vacuum tubes carry a nebulous "emotional factor", not possible with even the best solid-state devices.
Computers? I make my own, easy enough with building blocks.
But hey.
The first color televisions still had better pictures than today's fancy monitors displaying a computer generated image.

I go out and buy anything I want. But what fun is that?
I go and find discarded junk, and build stuff.
Sure, I like mathematics, also.
But well, you know.

Analog is strangely enough going to figure very highly in a new generation of computer technology, even as the biological chips will.
The old times are not dead.
Try to go back into the knowledge which was available in the 1800s.
See for yourself how brilliant people were with various sciences, not just electronics.
Try to get the textbooks.
Try to get.
This getting is becoming harder, leading to an almost total dependency on the system.
Hey, I don't want a computer or an air-bag in my car.
I don't want plastic pistons.
And I certainly don't care to work my butt off to get a new car that is designed to rust within three years.
A sewing machine? How many must you buy in your lifetime, while my mother's hand-cranked Singer still works?
My friend's Austin has been sitting in the rain for ages, and doesn't rust.
They used to put a little bit of nickel in the alloy, see.

As for obsolescence, there is far more obsolescence in today's stuff, everyone agrees, not because only the technological leaps are all that great, but because it is designed that the first stuff you get must be replaced.
They already HAVE the stuff made that you'll be buying ten years from now.
But you have to go through channels, and spend money and pay taxes.

I can fire up my tube HF set, and get stations anytime. It's great.
I can twirl knobs and dials, and kind of drive the machine.
My other equipment, I sit on my backside, and push a button on the remote control.
That's all I'm allowed to do with it.
And I'm stuck with the five kHz increments.

On the computers, I can talk to anyone in the world and with video, and no QRM.
That beats ham licenses all to heck. And it is fun.
It is great to have instant and accurate communications.
I love it.
But I also love doing it myself, and succeeding without dependence upon bits and bytes.

If we have an EMP, a lot of us can kiss our recreation goodbye, our jobs goodbye, and our finances goodbye.
I have wealth stashed outside of banks, and it can't be controlled because ostensibly it does not exist.
And I can Build a car from scratch out of junk.
And I can hunt and fight.
I can build transceivers and telescopes, do a fair bit of medical procedure, and a whole bunch of other neat stuff.
But the greatest of these lie in the magical realm of Tesla, Marconi, Fessenden, and myself.

So let's have a toast for the Old Dinosaurs.
We're not a bad bunch, and we'll still be around when digital has to marry analog.
Hans

Exactly right, as a component of analog.
Which is the greater paradigm?

Rocci says:

>The mixers - How to build a pair of mixers whose gain (loss) and phase
>track over several octaves of RF and also give good intermod
>performance. My goal would be at least 50dB of unwanted sideband
>s
Intermod is a problem, because it is non-linear. The other issues are linear and can thus be fixed anywhere in the system (i.e. in the DSP). This isn't exactly true, because incomplete nulling of the unwanted sideband makes the A/D deal with a bigger signal, but it is close to true.

>The I & Q IF filters - Some filtering needs to be inserted in the I & Q
>outputs to prevent out of band signals from overloading the ADC. Since
>these filters are at audio, they need to have very good phase and
>amplitude tracking over nearly a decade of frequency.

Adaptive filters in the dsp make this easy to deal with. The coefficients would be a semi-fixed set derived from a test signal (calibrator sig gen built into equipment). The receiver could go thru a calibration sequence every time it's turned on, or when the user presses a CAL button.

Different sets of canned filter coefficients may be needed for mixer correction at different freq ranges, but memory is cheap as beach sand....

>AGC - This one make my gray matter smoke. Signal amplitude measurement
>is most commonly done on the post-filtered audio DSP output. This D

With a complex representation, you have instantaneous measurement of signal power, the need for averaging over time is greatly diminished. AGC response time mostly limited by sample rate.

Be careful when you read the spec sheets for those magical 24-bit A/D converters. The THD and SNR specs aren't always what you would hope for.

I have a nice atv downconvertor, used it a while, just run out of time for atv.
Its a modified uhf tuner, all solid state, covers 410-440, witha tweaked front
end for low noise figure, with ten turn tune pot and agc pot on front panel,
all in nice box with power supply.
can email picture if interested.
$25.00, easy way into atv
thanks
tf

I am modifying one of the Wavecom Jr. transmitters for use as a hat cam and I'd like to put a flexible rubber duck antenna on it. Any suggestions on where to find such a thing with say a BNC on it? I'd seen catalogs of this "spy" equipment where they do the same thing, and they have rubber duck antennas.... help.

FCC Title 47, Part 97.3(4) defines "Amateur (Radio) Service" as:

"A radiocommunication service for the purpose of self-training,
intercommunication and technical investigations carried out by
amateurs, that is, duly authorized persons interested in radio
technique solely with a personal aim and without pecuniary interest."

In other words, I take issue with the statement that technical service
is the "majority of our Basis and Purpose"; obviously, the FCC
considers self-training (in radiocommunication), radiocommunication,
"personal aims" and volunteerism to be well within the purpose of
Amateur Radio. Certainly, we'll each lend more weight to that portion
that most interests us personally. And isn't that perfectly OK?

>building things I can "play with". It's kinda tough to change the

As Carl explains, the Handbook has an explanation, a good one. But
don't overlook the manufacturers; many of them have excellent
tutorials available on line. (I'm thinking of HP's great app note on
digital communications basics.) Any ham that loves to learn will
seek this stuff out. I am not an EE by training, probably never will
be, but I *can't* be stopped from learning.

Even "macro" parts like a big IC can be tweaked; who hasn't debugged
an IC opamp design by adjusting the feedback resistors? I'm sure
engineers would wish it if they could drop the parts on the board
without thinking, but that's not so.

Where the benefit is for me is that modern parts are most readily
available for the things I want to do (digital comms., video.) and
there are reference designs available. I don't enjoy the prospect of
reinventing the wheel not once but multiple times in an endless
progression of ontogeny (making leyden jars, then alternators, then
1-tube radios, then 5-tubes, then ??? Someday I'll get to AM if I've
been a *really* good boy...)

(Besides, I *hate* point-to-point construction. And I have a laser
printer for PC layouts and all the stuff I need for SMD... Rule One
for any ham projects should be: Use What You Have.)

Re Carl's argument: I have an argument I use against Luddites (not to
claim that of anyone here): In a technological society like ours,
people are free to use as much or as little tech as they want. No
one's making you put together a 256-QAM modem, I certainly have far
better things to do than shove a databook CD at you at gunpoint. :)
Or take away your 6L6's or your discretes, let alone your key. I'll
defend anyone's right to build amps out of three dozen 2N2222's.

But, if the reverse position is held, and I'm enjoined or discouraged
from using "newer" technology because it "isn't done" or that I
"didn't do it the old fashioned way" or "it's not pure, noble, or
simple", that's bad for me. And probably bad for amateur radio.

I've had a negative image of hams of late. Too often, I'm reminded of the Florida citrus commercial you may have seen on TV, depicting an old man in a musty back room, thumping an equally musty, thick book, shouting "GRAPEFRUITS *MUST* BE EATEN IN HALVES!"

Do I hear that old man shouting, "*REAL* HAMS DON'T DO NO (silicon) CHIPS!" or "REAL HAMS DO <insert favorite good-old-day-ism>"? I fear that's the perception.

I don't believe in the "Good Old Days". Memories are rose-colored, true, but they're painful to behold when an idealistic past is held to our imperfect present. People turn bitter not only because the present isn't as "good" as the past, but also because *their* past isn't as good as The Past.

We patronize, as well, those earlier times, believing that the likes of Maxim and Marconi somehow knew that *they* were in *their* Good Old Days and never had to change, as if their hard-won experience and expertise were somehow bestowed on them from God.

These days *are* (or should be) the "good old days" for me. Building "new-fangled" things is just the easiest way for me to get started and have fun. I'd love, for instance, to talk to people like Gary who are doing digital comms. with just a few chips. PSK31 with a good, cheap, small HF rig. Or to repeat the experiment someone did that carried an H.323 videoconferencing system over the ham bands. THOSE things intrigue me (and anyone else I could elmer.) These things are the future for me.

I *understand* and *respect* that people like the old things. But it's just not in my heart to do, and if I were *made* to do such things as learn 30WPM CW, or build 1-tube rigs until I was deemed worthy of higher things, I would lose all that made me get my ticket in the first place. (Did anyone make you build an alternator, ignoring the regulations against spark?)

To paraphrase Churchill, when we fight over the Good Old Days, we lose the future. If all hams resist change such as some have here, then we're losing the future.

73, Dave N1KGH

P.S. Anyone else interested in the same things, I'd like to hear from you privately. I'm in the Internet Elmers' directory

Here's the scoop, one way I see it.
Nowadays, we have state of the art SWL radios.
So something goes wrong.
The fix?
Plug in another IC.
If that doesn't work, plug in another complete chassis.
Finally, just buy another radio.

All told, the old guys have been there, and they are here.
The newbies are only here, and don't even know what a pornograph is.
They've never seen one, so they don't believe in wax cylinders being played on a wind-up machine.

They've seen CD players. And know all about them.
So do the old timers.
There are so many ICs in there, numbers so and so.
Same with cell phones.
Just look in the book and quote numbers like mad, the way we used to do about Hemis, 327s,
quadrajet carburators. Four on the floor! Hurst shift!
Wow.
Today? Aim the remote control at the car and it starts for you.
Stuck? Call the automobile assn.
Everything is throwaway.

Now, WE know how to actually take a Mason wide mouth canning jar, and build some structures inside, evacuate the air, and rig up a thousand Watt transmitter post-haste, using coils from the vacuum cleaner and home-made condensers.
The thing can be fine-tuned against spurious emissions, or just left however it works in an emergency to save a life.
And no cell-phone will function anywhere nearby, in that case.
Not a good idea.

But the things that can be done.
And then we can always go out and buy the same darn stuff the young whippersnappers do, anyway.
So we got both.

We can BUY what we can't figure out.
But can the contemporaries purchase a regen that easily?
Oh, boy! Did you know that the Military is using tube transceivers as back-ups, just like the Russians do?
Some kids today seem to be walking pincushions and porcupine lookalikes.
Paintbrushes in the biggest pants made.

At least the visible ones on the corner by the pop-shop.
The intellectuals are social outcasts.
The druggies don't care about nothin', man.

The city I'm in for five years, has plenty of kids.
They're all good.

But some of them, you know are going places.
I have not found even a single one, and I've been looking, which seems to be even remotely interested in anything other than to feel cool and find money.

Most of them are alright until they get to school.
Then very rapidly they can change forever.
I read about the process in Karl Marx's Communist Manifesto, where he goes on about planned decadence.

The kids who did make decent marks in spelling and grammar, went on to succeed in college and university, where soon they were given passing grades.
Some few of these still don't know nothing.

Everything taught today is engineered only toward one bottom line, and that is efficiency in money-pumping for someone else.

There are the cream of the crop, who actually understand what they were taught.
And these have much more to learn, but don't think so.

One in a blue moon graduate continues to actually think for himself, instead of parrotting pet phrases.
It is this rare creature, who might very well be interested in learning things considered archaic.
That is, if he can find the time, which is unlikely with the system we've got.

There are recruiters roaming the schools, looking for candidates to serve their agendae.

How many people actually escape all the traps?
Probably none.
The system is very efficient unto itself.
It is an entity, a monster.

Work, and you shall have toys.
Get sick, and it's off to the abatoir.

So with so little to to look forward to in life, I can't blame all the kids, not really.
I get so pig-biting mad, when I stop to think about technology.
It has advanced tremendously, yes.
But it serves finance, and that is all.

Remember, all you old guys, the promises about labor-saving devices?
The American Dream?
A hot rod Chevy which didn't crumple up if you looked at it?

Real American products, made to last.
Good old American know-how.

Could we get a Cadillac with a Mitsubishi engine back in the fifties or sixties?

We've come a long way.
And of course, to those who haven't experienced the past, everything is great,
and right how it should be.
Where are my dentures.
A while back you could get porcelain teeth in dentures.
Today they talk about it, but give you plastic chiclets.

Ever notice how more and more is said about less and less?

Now I am listening to Radio Hilversum, and tinkering away building a hyperspace
window with which to save the world from the Dracos.
I guess . . .

It is nice to be retired, for the time it gives one.
It is nice to be single and not dependent upon the goodwill of associates.
It is nice to be able to go out and buy anything you want.

Life is good.
And we made it that way.

Hans

Wait til I get offa my rollerskating camel and wind up the string of my packet kit.
Okay. You must be a skateboarder, right? sensory surfer-
Here is the scoop for that question, which you can verify.
I put out an idea on my website three years ago, regarding a concept I came up with way back before you were even a glint in your pappy's eye, that is 1988.

The Trifilar Diamond Laser weapon.
Something told me to take it off "post haste", and I did.
Just last week I came across an article on the Net describing the strange tubules found within diamonds.
Think on that, and you'll see I was not very far off the mark.

As to your question perse, the phenomenon is valid and can be verifies, which I'm not going to do for you.
As to making money, I don't need it.
And as in regen receivers, hey. It is more fun to lie still for eight hours peering through a scope, waiting for the target.
I can still plink, if you have any idea what that means.
But killing is a waste of time.
Besides, it's illegal unless the government has a war.

Pretty well at any time, there are 84 wars going on in the world.

Not a pretty pic.
Chiao.

Just finished a little nap, and thinking about your question some more.
Getting filthy rich isn't my idea of time well spent.
Making rifles like those you refer to, would amount to the point being made in all these posts.
It's just no fun.
Press a button, ten deer bleed to death for your pleasure.
Yuck!
The way we used to do n the old days, was to strip naked and put a knife between our teeth.
Then we'd lie in wait for the deer.
When one came, we'd chase it down on foot, and kill it.
That was fun for sport and food. But as we grew older to say about sixty or so, we'd have to resort to rifles.
And then only to eat, since the running sport was out of the picture.
Breath control can be very important in many areas. Good to learn and practice.
Trigger control is something my concubine is muttering about.
Perfect sight pictures were found on TVs when they were first produced.
The natural respiratory pause and breathing control were not mandatory for an adept.

I used a Weller soldering gun for years, and ended up being able to shoot a rifle or pistol without sighting.
I would hit the target every time. Wherever I looked, that is where the lead landed.
That is called "plinking".
Clocks are time machines.
But the kind you mean do exist.
Not for killing perse, but for travel.
You'd have to understand 3D math to grok that precept.
The Philadelphia experiment and the Montauk Project were real, and in fact Montauk has been revived in the last few years.
Has to do with the time loop we're stuck in now.
The world has already ended and vanished along with 'heaven' and everything else in this dimension.
We're still here, most of us blissfully unaware of the countless repetitions we've already made of our lives.
The push is on to break the time loop and enter another dimension with the so-called help of the Dracos.
The Dracos won't help us, they help only themselves, to us as their snacks.
So you may be in your last cycle, finally.
This conclusively proves that we are ALL old-timers, even one as young as yourself.
You've done this trip many times, and are probably well over four thousand years old like the rest of us.

The only way to escape the finality, is to use my hyper space window.
But everyone laughs, doesn't care much.

Strange.

Where did the voltage regulators come from?

I don't have the exact diagram you are using. The 1961 edition has
something similar, though I'm beginning to think that the function
switches aren't quite the same, and it has no VR tubes.

What voltage do you measure out across the filter capacitor in the power
supply? Be careful! What does the schematic show the voltage being at
that point? It's bound to be somewhat different, but if there's a big
variation...

If the schematic is like all the variations I have around here, there
should be a variable resistor of some sort between the high voltage line
in the power supply and the voltage regulator tubes. If that isn't
adjusted right, the regulators aren't going to work properly. There
should be something in the text about adjusting this for proper operation.

Don't adjust the resistor with the power on. And short the filter
capacitor before making any adjustments.

If by chance it's a fixed resistor there, it may need changing if the
power supply output differs from what's shown in the schematic.

If you look at the back of the Handbook, there is data for common
tubes. Mine shows the plate voltage for the 12BY7 as 250volts, and the
screen as 150volts. Something has to be wrong, either in your meter, or
the power supply and voltage regulator section.

The tables show the 0D3 to be a 150volt regulator, and the 0C3 to be a
105volt regulator. So the voltage across the 0D3 should be 150volts.

The table shows the 1625 maximum plate voltage to be 750 volts, and it's maximum screen voltage to be 300volts. I'm assuming the plate of the 1625 gets fed directly from the output of the rectifiers in the power supply, and it's the regulated 255volts from the anode of the 0C3 that feeds the screen grid. Again, the voltages you show are too high.

The voltage across the filter capacitor in the power supply probably will vary some between key up and key down. And between the tune and operate position, since in the tune position the 1625 gets no screen voltage (unless that's different from the transmitters I'm looking at). But the VR tube voltages should stay constant no matter what else, which is the point of the regulators.

We can work on the rest once the power supply is putting out the correct voltages.

Hi,

thanks to all those who offerred their assistance in this matter.
Having weighed the pro's and con's of each suggested solution I'm
going to look for a topology with greater isolation.

Thanks for all your help to date!

Regards,
Richard VK5OO

No offense taken as I ment it with tounge in cheek. Kind of reminds me of Back to the Future II when the '55 version of Dr. Brown had to reconstruct the microchip from tubes and coils. They show the Delorian driving off with 3x2 foot bread board of tubes on the hood. Now that was funny.

The old Eimac book, Care and Feeding of Power Grid Tubes has
a section entitled "Vapor-Phase cooling" that discusses this
subject.

To quote: "Raising the temperature of one gram of water from
forty deg. C to 70 deg. C (as in a water system) requires 30
calories of energy. Transforming one gram of water at 100 deg.
C to steam vapor requires 540 calories. In a vapor-cooling
system, then, a given quantity of water will remove nearly
twenty times as much energy as in a water-cooling system."

It seems Eimac knew all about boiling water type cooling.

Honestly, David, I think this is a myth, an invention that has taken on a life of its own. I have *never* heard or read of somebody *seriously* saying hams shouldn't use this or that new technology, or *must* use this or that old technology. What I *have* seen many times is that somebody asks about building a simple tube or transistor project and they get a response like "regens, yuck!" or "get with it on some up-to-date stuff" What bigotry I see is against old technology, not new technology. (Me, I make my living with the latter, but prefer the smell of the former <g>.)

73,
Mike, KK6GM

>What are you guys using for the HI Z 10MEG 350 MHZ or faster
>probes? I need your help.

The 485 has "only" 250MHz bandwidth with high impedance probes. To get
350MHz BW you have to turn on the 50 ohm terminators and use low impedance
probes (Tek P6056, P6057, or home-made).

You should be able to find used Tek P6106 or P6106A probes at a reasonable
price ($30?), or P6130 series probes for somewhat more.

You can get new no-name 250MHz probes from Alfa ($29), BelMerit ($34) or
Farnell ($29). For details see: http://www.spies.com/dd/probes.html
I don't know of any low cost probes with the readout pin though.

(Newsgroups edited)

This has got to be one of the oldest threads in ham radio.
I'm reading letters to the editor in a 1923 QST and someone
is bitching about the guys who don't build their own stuff!

My brother is an archeologist working with SE USA aborigine sites
and has found glyphs strings on soapstone. 3,000 years old,
depicting the man who doesn't grow his own tobacco and
make his own pipe as a slug ;-)

Hey, anyone got any sockets to fit WE 231D?

Have a dozen 7027A. They are used but I don't have any
use for them so if anyone wants to swap some older transmitting
tubes that have good emission for some good used RCA 7027A's
send me some mail.

-bob

I am a professional software engineer and a long time short wave
listener.

I have developed a Windows program that allows you to filter audio in
real time.

Connect the "Line Out" on your short wave radio to the "Line In" on your
PC's sound card.

The program takes the signal, digitally enhances it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a free Shareware copy of the program visit my
web site:

http://www.winternet.com/~swezeyt/dsp.htm

Thanks a lot,
Tom Swezey

Does anyone have a schematic for a simple converter that will convert shortwave frequencies to something that a scanner can pick up? I know this can be done with the Phillips SA-602 Mixer but I just can't remember how. Also do scanners automatically distinguish between AM an FM on any frequency?

Tony

Sorry Hans, nosale. Back up your statements with numbers and science please. Just what is "a whole
lot faster".

The time issues with B&W vs. color has to do with how the human eye response to light stimulus and
the fact that color tv's incorporate 3 electron guns instead of one and the added amount of information needed to be decoded by a color tv. It has nothing to due with your unfounded statement
of "black and white is a whole lot faster than color". I am of course assuming that you are refering
to the actuall EM propagation.

Hello--

Right! The "F" is Fairchild, and the 9960 was a component of their "counter micrologic" family-- symbols cul where the "u" is a lower-case Greek "mu". Hope that helps further--

.H .H Russell wrote:

> I really can't do the math anymore.

Really? I havn't pickup a physics text in ten years. One of the other engineers here had his
freshman text so I just barrowed it and solved for the vacuum tube over my lunch hour. The math
is pretty simple, algabra only and all classical. I should think that you could do simple algabra.

> I just did. Sound and EME are not mutually exclusive.
>

I got a whole floor of physicist a mile away from me who say your wrong. I can give you names
and addresses if you wish. I prefer the consol of real people and not "this scientist on a web
site says".

> It is definitely what I had in mind.But the math, I would have to study for a year to bring
> it all back.

Hmmmm.... took me about half an hour. Really now, is algabra that tough?

> I won't use incomplete bits and pieces if do calculations, and some of these
> calculations won't follow accepted standards.

They better if you want any one to take you seriously.

> So it is better left to you youngsters to find a way to make my statement true.
>

Sorry Hans, your theory, your proof. Put up or shut up as they say. BTW you cannot "make" a
statement true. It either is or it isn't. That reminds me of the church in the dark ages. They
new that the earth revolved around the sun but for social/religious reasons they keeped it away
from the common man and went so far as to persecute Gallilao. They "made" thier untrue
statement "the sun revolves around the earth" true. But it still didn't alter the fact that the
earth revolves around the sun.

> By the way, there is a perspective which would be called cheating by some, but in that
> perspective you enter three-dimensional mathematics.

Hmmmm..... I studied n-dimensional math and tensor calculus, I don't recall seeing anything in
the nominclature about "cheating".

>
>

Okay, here are the numbers for the tube

I will be using F=ma given by Newton in his Pricapia (SP sorry Issic) and the following:
E=F/qo (eq. 18.2) where E=electric field in N/C, F=force, and qo= charge of the electron
E=V/d (eq. 19.7) where E= electric field, V=applied volage, and d= the distance between two plates.
and d=1/2at^2 (eq. 2.8) d=distance, a=acceleration, and t=time
The last three can be found in Cutnell and Johnson's 3rd addition of *PHYSICS* published by Wiley in 1995.

So assume we have a triode tube where the plates are .5 cm apart and we have an applied voltage
of 200V. I think these are reasonable paramaters.

Then by 19.7 we have

E=200V/.005m=40,000 N/C

sub into 18.2 gives

F=Eqo = 40,000 x 1.602xE-19 = 6.408xE-15

now sub F=ma and we get

a=F/m = 6.408xE-15/9.109xE-31 = 7.0348xE15 m/s^2

now by using d=1/2at^2 we get

t=sqr(2d/a) = sqr(2x .005/7.0348xE15) = 1.19xE-9

or about 1.19 nano seconds.

I have of course, not taken into account the setup time of the the E field after the grid potential is dropped nor have I added in the slew rate of the grid drop. I merely assume that
the grid drop is instantanious and that when the electrons strike the other side they will immediatly began "energy transfer".

Now I have decided not to do the math for the semiconductor since it involves quantum mechanics
and if you can't do algabra I don't think you'll follow the math. You could just say that I'm
"cheating". For those that are interested the flow of electrons in a semi conductor is discussed in detail in Omar's text Elementary Solid State Physics published by Addison Wesley.
I used the first addition published in 1975. I will give a short discription though.

In order to conduct, the electrons in the valance shells (valance band) of a semi conductor must absorb enough energy to make the jump into the conductance band. The distance between

the
the two bands is not physical but electrical in nature and is know as the Energy gap. It's value is given in eV and for Silicon the value is 1.1eV. The time that it take for the electron
to make the energy jump can be calculated like all energy state shift. Any one interested in
these calculations are refered to Kenneth Krane's, Introductory Nuclear Physics, published by
Wiley. It is known that these jumps take place in the sub nano second range and once the jump
is made, I am assuming, as I did with the tube that flow begins when the electrons jump from
the the valance band (cathode) to the conductance band (anode) (I could be wrong about the cathode/anode direction, I always get them confused).

In other words the time it takes to get conduction or "energy transfer" within a semi conductor
is in the sub nanoseconds. Of course this works on a quantum basis and therefor it must be treated statisticaly since not all electrons make the jump at the same time.

At this point since I did not do the complex math you may be temped to call me a cheater. So
instead I will point to an imperical proof. Go to Pericoms web page and down load thier PDF file ps2011b.pdf. You will find a data sheet on the 74FCT240T line driver. If you look at the
switching characteristics you will see that the propagation delay time from off to on for any
given gate is a maximum of 3.6ns.

In other words, from the time that I apply a volage on the input of a gate it will take no more
than 3.6ns for the electrons to flow.

I offer this as my proof.

Your original assumption was that a tube could provide transfer rates 80 times faster than semiconductors. I submit that the difference is actually about 3 times faster using the best
case senario for a tube and the worst case for a semiconductor. At this point I would ask that
any one out there who has a really fast digital storage scope could test actual conditions by
getting a suitable high speed transister and a triod tube and actually measure the time it takes for current flow vs gate on for the transister and grid drop for the tube. Real world proof would be interesting.

If you don't agree with my math or my statements then please feel free to refute them, but please do so with hard science and good math, not with "some scientist on a web page says".

Rick

So attention, Rick Haub!
Here we have empirical proof that the speed of light is not absolute, and certainly therefore by
the law of commutation and the axiom of permutative stabilization, also not those pesky electrons.
To wit,
Black and white is a whole lot faster than color.
White is light, and color is light.
Yet there is a difference.
Now consider, if you will, that black is commonly thought of as the absence of light.
But is that really true?
Black may be filled to the brim with colors which escape the human eye.
Just horsing around here. But Einstein did say that imagination is more important than dentures,
did he not?
-Something like that.
Thanks for the come-back, Roy!

As I remember, the hole center frequency is choosen so that it is were
there is a minimum of energy in the spectrum for a "standard" human
voice.

I plan to build a 1.3 GHz weaver method transceiver as described in
dubus
and use my DSP in place of the original audio section. But currently, I
assume that I will not use it in "weaver mode" because I suspect some
problem
with digital transmissions like PSK31. You must tune the LO, so that the
hole
does not affect the modem signal, so you tune below or above the digital
channel. Then you go back to imbalance problems because the image is not
in the channel !

I, too, would be interested in reading about techniques for making lo-z probes with wide bandwidth; I've got a Tek 7904 with 400 Mhz timebase and a couple 50 Ohm fast vertical amps, but no probes rated faster than 100Mhz.

The Weaver system has its pluses for ham radio where you can stand some distortion of the recovered audio, which at least in analog modes is the case. Nowadays, you can even build a DSP notch filter to remove the midband whistle.

However, the Weaver system is still direct conversion, with all the same problems any DC receiver potentially has: microphonics, ground loops, 1/f noise, the requirement for a DC coupled IF (probably ruling out the use of triple balanced mixers), and conversion of AM noise on the LO to bandband.

And you do have to worry about amplitude balance between the two paths to minimize audio aliasing.

You also have to consider that if you are building a simple receiver, you can probably use a CB radio IF filter to do the SSB so why bother with Weaver. If you are building a high performance radio, the low pass audio filtering is going to get complex so again you might be better off building a homebrew crystal filter from microprocessor xtals.

Another isse, is: what are you going to do on xmit? If you use the Weaver system there, you have the whistle problem. This is even worse than the carrier suppression problem in phasing type SSB, which is what effectively killed it for all non-ham radio uses where there is an FCC spec on carrier suppression. You see, in those services, they rely on the SSB filter to also help suppress the carrier. In ham use, they just put a pot on the front panel to null the carrier and/or drove the modulator higher (to make the carrier look smaller) and let the intermods fall where they may.

Aaahhh, yes Hans, exacly the response I expected from you. Now that you've been cornered your rhetoric
is your only defence. You know I agree with you about the value of imagination. Imagination is the
door to inovation, it is the "what could be". But between "what could be" and "what is" is a large gap
of truth. These truths must be discovered and laid bare. The gap can be spanned and the men who do it
use the tools of math and known principles of physics to build the bridge. They use the references of
the men before them like Archimedes, Newton, and Einstein. Those equations I used where not mine, they
were Maxwell's, a revered man of science, not "this scientist on this web site".

If you want to place your ideas out in a public forum for all to see, fine, go ahead. The other
engineers here have gotten quite a few laughs from your latest post. As for me the entertainment value
of an intelectually frustrated individuals posts have worn quite thin. And since you have nothing else
to offer, welcome to my kill file.

Next!

To the rest of the community here I'd like to apologize for letting this get so far off-topic. Thank
you for your patience.

Rick

You have a 125:1 difference between the primary and secondary in the transformer you specified, two orders of magnitude.

True, coil impedance is not exactly the same as (dc) resistance, but I think a simple check with an ohmmeter should make it obvious which is which.

Nunnelly wrote:

I am certain your apology is well founded, and really not necessary.
If I restrict you with rhetoric or anything else, you are likewise cornered.
In fact, you are cornered, and are using the worst,most hideous and pompous form of rhetoric yourself.
The large percentage of religious people know exactly what they believe in, and you would attack all of
them with your stipulations for proof of the truth.
Maxwell made mistakes, and you still use them.
The second law of thermodynamics is fallacious.
Come on. Your so-called scientific method which as used by you, is hardly more than another fanatical sort
of religion, a shield for your delicate ego and shattered intellect.
The falseness of your approach as indicated by the sudden turn to visciousness is what is really
ridiculous.
You are one who can imitate the truly great men, whom you deign to emulate for succor.
There are failings within your psyche, probably due to overwork at social acceptance.
You crave recognition as at least an equal in society.
But your methods are deplorable and meant to be destructive.
Incidentally, I aced mathematics, and this can be proven, although I shall not do so to your ilk.
I am lazy.
Therefore I don't revive the process.
I have done many things, and more than even you will ever dream of, with your stultified and atrophied
flair for originality, as well as your utter refusal to look at anything which you can not understand due
to a vitamin shortage or something.

The same laughing colleagues you speak of laugh not only at that which you presume, make no mistake.
They laugh also at you, either because they consider you ignorant to be sucked in by a stupid old man, or
because they know you merely wish for a cracker.
You have led me into a soap-operatic paradigm, to divert attention which you crave from your ineptitude,
to a social situation of mudslinging old hags.
This is not my preferred activity.
You are a fomentor, a trouble maker.
You attack everyone and everything you happen to stumble across in your relent search to elevate your
petty ego.
Your mathematics and arguments are pathetic and no more than I would expect from a Military

McCaw.

You have no originality.
You have no basis in fact OR imagination, what you have is a repertoire of cliches and verbal
abuse.
You begin politely and interestingly, then as soon as you think you spot a weakness, your true destructive
yearning rears its ugly cranium.
This is borne out and provable even to you, by reading your past postings to other people.
Incidentally, all postings on newsgroups are archived and accessible by and at DEJANEWS.
Prove that to yourself, and learn social skills.
Whether I choose to do your mathematical hoop-jumpings or not, does not change what is true.

You have absolutely no interest in anything except recognition.
While it may be true that you attained master standing in your courses, nevertheless a modicum of spelling
would seem to be essential in the higher forms of mathematical endeavors.

A lack of spelling talent clearly demonstrates a lack of spatial awareness and the ability to utilize
mental imagery effectively.
Therefore I would say that you like to process along a linear fashion.
Now I take all of the above back, as it is not my nature to be insulting even to people such as yourself.
I also wish to not allow you to corrupt me into your area of socialism.

So back to square one.
Vacuum tubes transfer faster than solid state by a factor of up to eighty.
It is so.
You want it, earn it.

When you started out in life, you did not demand proof of everything your teachers told you.
You just learned and tried to pass grades.
Eventually, you bought into the system and made their thoughts your own.
All of a sudden, everything coming from outside of those thoughts must be proven.
Not for the reasons you stipulate, but to protect your form of religion,
your treasured petrified mindset.

You seem to be incapable of accepting newness within your delicately structured fortress.
You mentioned about the sun and the earth and the revolving relationship.
The earth revolves about the sun but not vice-versa?
Check the galactic cycles.
There may be one turn of the sun around the earth every so often.
At the same time, you say that two multiplied by three is the same as three multiplied by two.
The process is not the same, although the numerical result seems to be.
I can't seem to teach nuclear physics to my cat.
I should learn to not bother.
Again, all of the above is just playing into your hands, and I apologize.
But please, all bantering aside, do continue to think about the speed.

Please.
I know I have faults, everyone does.

But I have an ego just like you.
So research, Rick.
You're halfway there.
Hans

I once repaired a 1902 Victrola. Not an edison cylinder unit, but 78 RPM.
(I have an edison unit)

It needed a new spindle for the spring assembly, so that you could wind it
up properly. A little lathe work, and it was as good as new.
I also discovered the origin of the term "Stick a sock in it!" as the only
volume control possible is mechanical, and they are suprisingly loud.
My mom asked me to "turn it down".. :)

This of course was before I got my ham licence, now that I've passed the
code test, I doubt I could do it again ;-P

What's that- pass the code test, make a spindle, or put a sock in?
:)

Mathematics?

Hokai Maru.
Three Apples multiplied times two Oranges equals what?
(3A)(2O)
Equals six quantities of fruit.
Who said you can't do that?
The point is coloring.

Now this:
(3R)(2Y)
> R+R+R+Y+Y
But.
It is not the same as in:
R+Y+R+R+Y
The point is position.
And also leads to procession.
I apply three coats of red paint and also two of yellow paint.
The order in which I apply them, determines different resultant tones.
The point was procession.

Further:
Temporal placement.
If I apply any two coats before the first one dries, we will have a mixing.
Extend this to any combination or permutation of wet/dry applications.

Add to this the sequence, and you have many resultant outcomes from a simple basis.

If I divide one apple by nothing, I still have one apple.
But if I divide no apple by one, I have nothing.
So 1/0 is not the same as 0/1, but you swear that it is.

One can not look only at the results of one particular arrangement, and claim that it is true in all
cases.

Three apples multiplied by nothing is still three apples.
But nothing multiplied by three apples is nothing.

So I would say that you cannot multiply a nothingness by a something.
And you can't multiply a something be a nothingness.

Yet what you had at the onset, is what you have at the end.
So this expands an earlier statement into:
You had a nothingness, and tried to multiply that by three apples.
So you must have had three apples to multiply by.

Thus the process is semi-prohibitive.
But the results still exist.

In order for this to be clear, we have to determine the field of operation.
It does no good to multiply an orange in New York by an Apple in Amsterdamn.
Placement is important.
You have to think locally, or globally.

What is the parameter of influence.
The world, the universe, your lunch-box, your imagination?

By the same token, Rick, we can do mathematics with values now, and pertaining values in an other time
arena.

Thirty pennies multiplied by two acquisitions equals a total reap of sixty pennies.
Yet you might not actually HAVE the sixty pennies, since you got thirty of them ten years ago, and thirty
today.
So math can be spaced over various time domains, yet apparently still yield identical values as if the
time domain were a constant and the same for all components.
Hence it is critical that to effect a computation for an instantaneous occurrence, the factors involved
must be at that same instant.
Enter phase-shifting, vectors and determinants, matrices, and so on.

If one travels at sixty miles per hour, it matters very much whether an hour was measured, or another
length of time.
It matters too, where in the time line that hour was placed.

Sixty mph for ten minutes is the same as 60 mph for two hours insofar as a speed designation is concerned.

It is not the same if we are considering distance.
So it is important to always look at the forensics of the intrinsic values and appellants.

I can't say to the peace officer who caught me, that I was doing only forty-five miles per hour
because I was doing thirty yesterday when he wasn't around and sixty today.
Yet the average speed says so.
Nevertheless, I might have been doing thirty yesterday for ten hours!
And sixty today for four minutes.
The fact is, I was speeding, and for how long is relevant.

We can average the speed.
Now what about the distance?
No. That totals up.
It does not seem useful to average the distance and claim that I traveled so many miles per day when in
fact I did not, I traveled so far today, and a different distance yesterday.

Brings to mind, this averaging does, about the rounding out of numbers?
Where does the accuracy go but out the window, when we round numbers?
And how can you avoid doing so, especially with decimal fractions involved instead of common fractions?
The accuracy and precision of measurement is not perfect.
Therefore the results of any computation based upon measurement is not perfect.
You mentioned the fellow's name-
Combine this imperfection with rounding out, and you compound the error factor.
Further complicate matters by using limitations in appellation, and it is worse yet.
More problems added to the soup with faulty theory and formulae.

Throw in a few spelling mistakes, and it is a mess.
Yet you ask me to use this system?
Your position is shaky, just as much as mine is.

More to the point, I know something which you don't, yet.
I try to communicate this knowledge to you.
You don't speak the language, and want me to use yours.
I don't speak the language you want in this case, because it is not the right language for the claim.
I am a lettered physicist, right?
I go to Papua New Guinea, and start to teach.
Nobody will understand me at all without knowing the language I'm teaching in.
Okay. So we end up speaking the same language, but they still don't get it, this time because the
mathematics is different.
Or the conceptualization.
Much too difficult.
So they ask for a prototype, and I set off a Cobalt bomb to demonstrate.
The proof was there, but we ended up too dead to appreciate it.
Now another country from afar, witnessed the explosion, and identified it as being that of a Cobalt bomb.
So they know it exists.
But they missed the process of construction, and can't prove it.

The onus of proof can be a pain.
That is why in the military, we have the system of commanders.
These men know, the guys below don't need to know, only follow orders on how to do things.
They don't need to know.
The results derive.

If the men want to know how something worked, they can go figure.

We can have a person who discovered how to do something, yet had no knowledge of science or mathematics.
He/she can repeat the process any time.
You would lose out if you demanded mathematical proof.

So alright, you say, "Hans, that's fine. if you're too stupid to do algabra, show me physically!" .
When I ask how, you want a digital storage oscilloscope.
Well. I just happen to have one, and believe it or not I can prove it.
In fact i already proved it, but you may have missed it.

Check this thread near the end.
There is a jpg. In the jpg is the scope.
However, rhetorics permitting, I don't know if the scope would be an accurate demonstration.
I don't know everything, and you won't ask for proof of that of course, so I want someone else to do my
homework and prove that valves are faster.
I want someone else to do the homework for you too, so that you will know also.
Post script:
There are ways and means of accomplishing short-wave communications which have slight precious
differences.
Those differences lead to enHansment of the enjoyment factor of SWL.

Hans

It's been many years since I've looked at the Weaver approach, so I'm a little vague about how you'd apply modern DSP techniques to it. But even with DSP, can you make a Weaver-method and conventional phasing receiver with the same hardware topology?

> It is so.

You know Hans, I really thought for a second there that you were actually going to get back on topic. I
thought you might even have a proof of your own.

I'm caught within the stricture of a pathetic scientific religion? What about you Hans? Read your own
statement,

"Vacuum tubes transfer faster than solid state by a factor of up to eighty."
"It is so."

Your proof is "It is so."? Is this *your* religion Hans?

"Vacuum tubes transfer faster than solid state by a factor of up to eighty. I am Hans and as I speak it, it is
so."

Remember the teachings of Mark Knoffler Hans, When you point a finger you've got 4 more pointing back at you.

There are very few things that get my back up but as a man of science one of them is going on the net a seeing
posts and sites from people who've reinvented "Tesla's Earthquake Machine", they just don't want to use it
because it will, you know, cause an earthquake. Or the guys who are on the verge of perfecting the dielectric
that will allow them to use a machine that will draw "Free Energy that Exist in the Universe all Around Us".
They all make a lot of noise, back it up with a lot of pseudo-science, but when asked for proof it's always
the same. "Oh, we can't do the proof yet but give us your money and come back in a few months" (years,
decades, never).

Am I attacking you personaly? No. Am I holding you accountable for statements said. You bet! Am I attacking

said statements. Sure am. Have I insulted you? Do you find my tone insulting? Perhaps it's because I'm tired
of signing on the net and finding Shaman selling snake oil. This is a free internet and I will fight to keep
it so. Anyone can say what they wish and if I disagree with thier statements I will not stop them. But I will
refute thier statements with my own. My right.

> You want it, earn it.

No Hans, I have earned it. With years of study and dedication. I know science is not precise. As a physicist I
understand this, as an engineer I live with it. But I stand with my proofs and I refute your statement. If you
want to prove me wrong Hans then do so. You say you can build things and you've acomplished so much. Why don't
you build a test bed with a fast transister and a fast tube, feed them a clock and throw the signals on a
scope and see which one is the fastest. Send me your results and the test bed. If your right, I'll put them on
the net myself and publicly apologize for attacking your statements.

You earn it Hans, until then I refuse to fall inline with the religion of Hans.

Oh, that thing about the spelling. I've got 3 forms of dyslexia, even the simplest word can be misspelled and
I wouldn't know it. I don't have a spell check on my editor and if I checked every word in a dictionary I'd
never get anything done. Nice grasp though, "a drowning man will grab even the tip of a sword" as they say.

{more crap snipped}

Hi Michael,

Michael Black wrote:

>

They must have been added later. Oh well I fixed that problem. A couple of the guys pointed out that wire wireing might be faulty, they were right. The OD3's ground wire was not connected. I fixed it and now I'm getting the proper voltages.

I replaced the .01 cap between the plate of the 1625 and the tuning cap as suggested and fired the rig back up. I tuned it then I switched to OP and keyed the rig. I got about a watt or two out of it when hooked to the 50 ohm dummy load. I hooked my scope up to the output of the plate and I saw 150 volts of DC on it. When I keyed the rig I could see a very small 3.5MHz rider (@3.5, I didn't measure it but I'm sure it was close to the crystal frequency). It this right? Or is the tube blown. I have two tubes but I was switching them in and out the night the rig went down. I might have blown them both.

This weekend I'm going to try to wrap another tuning coil and see If I can get it back up.

Thanks for the help!

Rick

2490. Heath manuals and Heath Warrior filter cap FS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-03 00:00:00 UTC
From: Ken Simpson <W8EK@fdt.net>
Message-ID: <hvWz3.3205$Dj2.200306@monger.newsread.com>
Source record: 67253

I found what I am sure is the original filter cap from a Heath Warrior amplifier.

It is 8 uf at 3000 V, oil filled, and has Heath part number 47472 on it. Mounting brackets are included.

Any one need it? $ 40

I also have the following Heath manuals available. All are originals, and are in good condition.

IO-103 Five inch scope $ 12

GR-2000 TV Set $ 12
GR-2050 TV Set - Five book set $ 18
GRA-2000-1 TV Clock $ 3
GRA-601 TV Clock $ 6

Prices do not include shipping from Florida.

E-mail to W8EK@fdt.net

Thanks.

73,

Ken, W8EK

Your right about the tuneing. I should know better. Some of the other guys have
told me not to use the light bulb method because the reactance of the bulb is such
an unknow and they might be right. If I have a good known 50 ohm dummy load I
should trust it. But, I don't know any hams, I saw a transmitter once when I was 15
but I had now idea what it was all about. So when I key the rig and I see that
light bulb glow, well, it's magic. The first time I saw the bulb light up about 3
weeks ago I felt a thrill of discovery that I haven't felt in years. The rest of
the guys might be right about trusting the meter and the dummy but I like the bulb.
And as you say, on a rig like this dummy loads and meters may be a bit much.

> > Well, even the best laid plans of mice and men go astray.

>

I try not to key it for too long but all the experience I have with tube rigs is
what I've gained it the last few weeks. I could have hurt some thing with out
trying.

>
> 73 es GL de Jim, N2EY

Well Jim, I fixed all those things then I tuned it back up and I keyed the rig a got about a watt out of it. I checked the voltage on the plate with my scope and I saw a 150 volt DC signal. When I key the rig the voltage drops to 130v and I can just barely make out a small sine wave on the DC. I'm kind of assuming the problems with the voltages, I may have made a mistake with my tuning coil. I'm going to try and wrap a new one this weekend and see if that works. Does that plate voltage sound right to you?

Thanks for all the help, I'll let you know what happens.

Rick

2493. FS: (long) High Voltage and RF components, ferrites and lots more

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-03 00:00:00 UTC
From: bw201@torfree.net

Sorry about the list being so long, but the Freenet does not provide web sites so this is the only way I have to list this all.

The following are personal items I have for sale. This is everything I have dug out of my storage boxes that I know I will never get around to using.

Minimum order $30 plus shipping costs. I will not respond to smaller orders
20% DISCOUNT ON ALL ITEMS FOR ITEMS TOTALLING $75 OR MORE (shipping extra)

Prices negotiable ONLY IF you are purchasing over $300 or if you are purchasing a large quantity of the Mica Compression Trimmer Capacitors.

E-mail your offers to bw201@torfree.net

Shipping is extra, but I can confirm shipping from Toronto, Canada and let you know the cost once I know where you are located. All orders must be prepaid but I can send you references of people I have dealt with on sci.electronics.* groups all of whom were happy with our dealings. Once an offer is accepted we will trade physical addresses and phone numbers.

I have done all of my shipping by surface or air, parcel post, insured by the post office so far with no problems.

Thanks

Qty. Item Price EACH in
All items have never been U.S. dollars
been used unless noted (ie. it says "USED") shipping extra

AND DON'T FORGET THE 20% DISCOUNT ON ORDER OVER $75

100 VG20X 20kV 15mA 250nS Rectifiers 2

100 VG5X 5kV 45mA 250nS Rectifiers 1.50

2 International Rectifier 67GC030H20LSS 3kV 4
1.25 Amp 150 Amp surge R-C compensated epoxied
blocks 2 3/8" x 1" x 1" with turret connections

2 High-voltage dividers marked "200 MEG" 6
and believed to be a total of 200 megs +/- 5%
and have a 15:85(?) tap. Looks like it contains
6 high voltage resistors, in a rubber compound
in a plastic case with three mounting holes,
4" x 2 3/4" x 1" with what looks like a 60kv lead

2 High voltage resistor 500 Meg 1% (F) in a 6
rubber compound in a white plastic box with
two mounting hole in tabs. One green wire at
one end and two red 40kV wires (internally
connected together) at the other end one with
an Anode connector like on a large colour CRT
Excluding the mounting tabs: 4" x 1" x 3/4"

2 TG-36 by Signalite ("less that 5uC of Cs137") I 6
would assume this 3" long tube with 3/8" metal
ends is a glass overvoltage/transient protector
in the kV range (3.6kV?)

1 Kilovac Stacked Ceramic High-Voltage High-Current 70
Vacuum Relay # KC-3/S10, 26.5 VDC coil, SPDT,
never used (plate contacts separated by 3/8"
thick ceramic tubes, 3/4" in diameter)
Rated at 8kVDC (or 8kV peak AC 60Hz)
25 Amps continuous current with contacts closed
0.1 Amp switching at 8kVDC (or 8kV peak AC @ 60Hz)
0.015&#65533; contact resistance. 18mS response time
All ratings are for purely resistive circuits
(actual price $56 after discount)

1 Kilovac Silicone covered Ceramic High-Voltage 40
High-Current Vacuum Relay # S709/S43, 26.5 VDC
coil, SPDT, never used, looks like HC-2 series
8kV rated (10kV test) 18 Amp continuous current
with contacts closed and 0.5 Amps switching
6mS response time

1 USED Kilovac relay, looks like a HC-1 series 15
but no part number. 3.5kV rated (5kV test)
18 Amp continuous currenct with 0.5 Amp switching
6mS response time. 115 VDC coil, SPDT

8 Steatite (Ceramic) Cone-shaped standoffs 1.50
1 1/2" high x 1" dia. at bottom with all hardware
(ie. two screws, two metal washers plus, a cork
washer for the base of the standoffs)
Very similar to H.H.Smith #9502

10 270pf 20kV X5R disc capacitors 2.50

10 250pf 20kV X5R disc capacitors 2.50

4 Used Sprague 715C-Z 1300pf 15kV capacitors with 2.50
Doorknob style with 8-32 female ends

1 Custom Capacitor .01uF 15kV reconstituted mica 12.50
2 3/4" x 1 3/4" x 5/8" with wire leads

3 TRW .0047uF 10kV film Capacitor 2 1/4" long x 2.50
7/16" dia.

48 1200pf 10kV Z5R red Disk capacitors 1.25

1 .02uf 3kv Z5U disc capacitor 1.00

1 .01uf 3kv Custom Capacitor - reconstituted mica 1.00
1 3/8" x 1 1/4" x 0.1"thick

4 Sprague .0082uf 3kV disc capacitors 0.75

13 .001uf 3kV caps 0.40

2 Custom Capacitor .25uF 2000 VDC Capacitors 6.00
turret connections and four base mounting screws

1 10uF 400volt Polypropylene Capacitor with wire 8.00
leads by Illinois Capacitor 2.25" long x 1.5" dia.
(I have marked with an alcohol based felt-pen and
NOT one using a stronger solvent that could damage
the capacitor) MPH series High-Current non-inductive,
self-healing design, 6 milliohm ESR, 0.1% DF,
15 Amp maximum ripple current from 20kHz to
100kHz @ 75°C (14.1 Amp at 85°C)

1 50 Ohm 10% Power resistor by IRC MPP series 4
NON-INDUCTIVE Could be 25 or 50 Watt
Metal ring ends (ie. not wire leads)

4 Jackson Brothers 7:1 Ball Drive, 1/4" input and 10
1/4" shaft output. These drives have an output
torque of approximately 26 OZ. These have a
2 grub screws on the output shaft for connecting
a dial plate and one U-shaped ear on the flange
for mounting. 1 7/8" total length.

500 4.7uH 10% axial inductors probably made by 0.125
Taiyo Yuden probably around 190mA max,
56MHz minimum self-resonant frequency;
about 1/4" long x 9/32" maximum diameter

1 RF power choke on 3" long ceramic form, coil 15
1.25" dia. 5 pi-wound sections. 10 Ohms,
probably in the 1.0 or 10 mH range, and
probably 500mA maximum current.

11 Ceramic variable coil forms for High Power VHF use 4.
by Cambion (Midland Ross) Part number: 530-3354-05
0.5" dia. x 0.7" winding length, 2 collars each
but with 4 terminals; Brass Perma-Torq slug for
100 MHz use and up. Slotted at both inside the
large core, and at the end of the 6-32 shaft.
Total length excluding slug shaft about 2"
For panel mounting

1 Variable capacitor #074055 with ceramic base 15.00
Panel mount with 1/4" shaft 6" long

50pf max. Should be good up to 500 volts

2 Cardwell #PL6078 ceramic based variable capacitor 15.00
Panel mount with 1/4" dia. by 1/2" long shaft
and includes a shaft locking nut to keep it
locked in place. Should also be good to 500V
Dual butterfly configuration.
25pf + 25pf max.

5 Dual VHF ceramic based variable capacitors 5.00
with phenolic mounting plate and 3 screw mounting
looks like it is about 8pf+ 8pf
Model # 80199

1 APC-100 panel mount trimmer capacitor 7.50
with ceramic base
100 pf maximum and looks like it should be
good to 350 VDC

4 Johnson Air variable capacitors Panel Mount 3.50
Model #189-563. 1.75-8.25pf minimum range
3/16" dia. x 7/32" long slotted shaft
0.45" x 0.5 x 0.5" deep body
Solid machined rotors. Lug mount

6 Johnson Air variable capacitors Panel Mount 4.50
Model #193-8. 2.4-24.3pf minimum range. 250VDC
0.5" x 0.56" x 0.65" deep body
Solid machined rotors. Lug mount

2 Johnson 160-102 variable capacitor Panel Mount 3.50
0.6-4.0pf
3/16" dia. x 1/4" long slotted shaft

6 Johnson 160-110 variable capacitor Panel Mount 4.50
2.7-19.6pf
3/16" dia. x 1/4" long slotted shaft

3 Johnson 160-205 variable capacitor Panel Mount 3.50
Dual butterfly unknown capacitance
but guessed to be up to 4pf + 4 pf

10 Johnson Air variable trimmer capacitors 2.50
1.5-5.0pf minimum range. 125VDC. PCB mount
0.35" x 0.35" x 0.35" in size
+45ppm +/- 15ppm/&#65533;C. Identified by a red "7"

1 Used 189-4 Johnson variable trimmer capacitor 2.
1.9-10.4pf guaranteed range
0.45" x 0.43" x 0.6" high. Lug connections

15 Johnson 193-29-34 variable trimmer capacitors 2.50
1.7-11.7pf guaranteed minimum range. 325VDC

0.5" x 0.56" x 0.6" high. Lug connections
+50ppm +/- 20ppm/°C

21 Tusonix Series 557 350WVdc 0.5" dia. trimmer cap 1
3-12 pf NPO

4 Tusconix Series 557 350WVdc 0.5" dia. trimmer cap 1
5-25pf "A" temperature co-efficient

4 Tusconix Series 557 350WVdc 0.5" dia. trimmer cap 1
8-50pf N750

5 Teflon high-powered UHF/microwave variable 3
capacitors all silver plated piston type.
Extremely rugged. About 1 3/8" long.
D-keyed mounting hole and connection is about
7/16" outside dia. on the threads (all
apparently silver plated). Second connection to be
made to silver plated tube about 3/8" long, and
1/4" ID. Looks like they must be good up to
3kV and capacitance guessed to be from almost
0 to 4.0pf.

1 JFD VC203 glass piston capacitor 24 turn 1.50
unknown capacitance about 1/4" dia. x 1 1/4"

1 Unmarked silver-plated glass piston capacitor 1
unknown capacitance same size as one above

11 Concentric cylinder air piston trimmer caps 1
4-30pf European style stud mount
1/2" in diameter by 1 1/4" long stud length
One connection by bottom of stud, other by lug
Hex-stud adjustment - not sealed

ALL JOHANSON TRIMMER PISTON CAPACITORS INCLUDE THEIR BRASS
SEALING CAP AND RUBBER WATERPROOF WASHER
All have mounting nuts except those with PCB mount leads.
All their models that I know of are all 0 ppm/°C and are
air dielectric and are extremely high Q (min. 5000 @ 100 MHz)

1 Johanson #2800 trimmer piston capacitor 0.32" dia. 1.50
1.0-10.0pf lug connection 12 turn

1 Johanson #2801 trimmer piston capacitor 0.32" dia. 1.50
1.0-10.0pf pcb connection 12 turn

1 Johanson #2802 trimmer piston capacitor 0.32" dia. 1.50
1.0-10.0pf turret connection 12 turn

1 Johanson #2950 trimmer piston capacitor 0.25" dia. 1.50
0.8-10.0pf lug connection 6 turn

1 Johanson #2951 trimmer piston capacitor 0.25" dia. 2.00
0.8-10.0 pcb connection 6 turn

1 Johanson #2954 trimmer piston capacitor 0.25" dia. 1.50
0.8-10.0pf turret connection 6 turn

1 Johanson #2955 trimmer piston capacitor 0.25" dia. 1.50
0.8-10.pf stud connection 6 turn

1 Johanson #4337 trimmer piston capacitor 0.25" dia. 2.00
1.0-10pf very long pcb leads 6 turn

1 Johanson #4610 trimmer piston capacitor 0.17" dia. 1.50
0.5-5.0pf turret connection 9 turn

1 Johanson #4700 trimmer piston capacitor 0.125" dia. 1.50
0.3-3.0pf turret connection 12 turn

30 Johanson #5201 trimmer piston capacitor 0.25" dia. 2.50
0.8-10pf pcb connection 6 turn
NPO +/- 50ppm/&#65533;C

1 Johanson unknown part number dual common 1.50
trimmer piston capacitor 0.25" body diameter
1.0-10pf 6 turn and 0.8-5.0pf 6 turn

1 Johanson unknown part number trimmer piston 0.32" dia. 1.50
0.6-5.0pf lug connection 12 turn, pink ceramic body

1 Johanson unknown part number trimmer piston 0.25" dia. 1.50
1.0-14.0pf lug connection 8 turn

1 Johanson unknown part number trimmer piston 0.25" dia. 2.00
1.0-14.0pf pcb connection 8 turn

1 RF Power QUAD spiral variable inductor 50
Each section estimated to be maybe 3uH max
6 turns. 2 1/2" long X shaft
Shielded box: 6" x 2" x 2"
P.R Mallory Co. #446S001

Addition to the list: Industrial limit switches

2 Micro Switch Corp. # WZE-7RQ9TN, Diecast Aluminum 6
Enclosed Switch (side-mounting) with Roller Plunger
SPST NC(monentary) 10A@125VAC, 5A@250VAC, 3A@460VAC
for CONDUIT - looks similar to the BZE6-2RQ8
Screw terminals

2 Micro Switch Corp. # WZV-7RQ9T1, Diecast Aluminum 6
Enclosed Switch (bottom-mounting) with Roller Plunger
SPST NC(mom.) 10A@125VAC, 5A@250VAC, 3A@460VAC, 2A@600AC
for CONDUIT - similar to the BZV6-2RQ80. Screw terminals

1 Micro Switch Corp. # BZV-2RQ, Diecast Aluminum 6
Enclosed Switch (bottom-mounting) with Straight Plunger

SPDT (mom.), 15A @ 125VAC/250VAC/460VAC Screw terminals
for CONDUIT - looks similar to the BZV6-2RQ

1 Micro Switch Corp. # BZE-2RN, Diecast Aluminum 6
Enclosed Switch (side-mounting) with Straight Plunger
SPDT (mom.), 15A @ 125VAC/250VAC/460VAC Screw terminals
for CONDUIT - looks similar to the BZE6-2RN
With water-proof actuator rubber seal boot

1 Micro Switch Corp. # WPE3, for CONDUIT - Army green 4
"Ordinance Part No. 7753261" Diecast Aluminum
Enclosed Switch (side-mounting) with Straight Plunger
SPST NC(mom.) No ratings stamped on the case
With water-proof actuator rubber seal boot
Screw terminals

1 Micro Switch Corp. # BZLN-RH, Diecast Aluminum 6
Enclosed Switch (side-mounting) with Straight Plunger
SPDT (mom.) 15A @ 125VAC/250VAC/460VAC for CONDUIT
wire connections

17 Micro Switch Corp. # DT-2R-A7, industrial switch 6
Long minimum mechanical life = 1 million operations!
Extremely high-reliability switches.
DPDT (mom.) 10A @ 125VAC/250VAC / 0.5A@125VDC
Pin plunger - six screw terminals. If you buy enough
to qualify for my 20% discount they cost you $4.80 each.
http://www.marshall.com has these at a $75.60 list price!

9 Micro Switch Corp. # WZ-7R
SPST NC (mom.) 10A@125VAC, 5A@250VAC, 3A@460VAC 0.75
pin plunger - solder terminals

9 Micro Switch Corp. # WZ-7RTC 0.75
SPST NC (mom.) 10A@125VAC, 5A@250VAC, 3A@460VAC
pin plunger - solder terminals

1 Micro Switch Corp. # BE-2R-A4 2
SPDT (mom.) 25A@ 125VAC/250VAC/480VAC
pin plunger - screw terminals (missing one screw)

12 Micro Switch Corp. # 1TB25-D8 0.75
DPST one NC one NO (mom.) 10A @ 125VAC/250VAC
0.25" quick connect terminals - plastic plunger

2 Micro Switch Corp. # V3L-27-D8 1
Roller lever actuator - 0.25" quick connect terminals
SPST NO (mom.) 15A @ 125VAC/250VAC

7 Micro Switch Corp. SM series subminiature 1
industrial switch with customized one screw mount
roller leaf actuator 5A@250VAC
solder turrets terminals - strong actuating force

99 USED - Micro Switch Corp. # 1SM23 subminature switch 0.25
plastic pin plunger - solder turret terminals
5A @ 125/250VAC

2 Electrical magnetic Circuit Breakers by Heinmann 4
AM1-A8W, 20 Amp, 240 VAC, 50/60 Hz, #20 time delay

14 Miscellaneous industrial, appliance and automotive
switches - FREE with the purchase of at least $75
(before discount of the above industrial switches
and circuit breakers)

74 Mica compression trimmer capacitor 35 - 250pf 1.25
2 lug connections with a separate grounded screw
adjustment grounded through a centered mounting
bracket - flat base style approx 5/16" x 13/16"
part number 310720850061
rivetted plate (ie. cannot be taken apart and modified)

53 Dual separate mica compression trimmer capacitor PCB 1.00
mount with capacitors set in ceramic block 1 1/16" x for
1 3/16"with maximum height of ceramic 7/16" high. each
Includes some silvered mica plates to limit range. dual
One capacitor is, 390 - 470pf, unit
the other capacitor is two sections in series:
first one 230 - 375pf, second 140pf fixed
Electro Motive part number 51102200
For you homebrewers, by removing the extra flat plates
(the slighty curved ones give the maximum variable range)
and just the silvered mica sections you can create various
combinations eg. 10 - 80pf with two plates one unplated mica
piece for the first section, and for the other section
20 - 120pf with three plates and two unplated mica pieces
or 10 - 75pf with just the top two plates and one mica piece.

236 Dual separate mica compression trimmer capacitor PCB 1.00
mount with capacitors set in ceramic block 1.0" x 0.7" for
x 0.25" Electro Motive part number 310720850911 each
Includes some silvered mica plates to limit range. dual
One section is variable from about 390 pf to 480 pf. unit
The other section has a fixed 150 pf (approximately) in
series with a variable capacitance of 260 pf to 340.
These can be modified similar to the 58 units above.

100 SFE10.7MA5A Murata-Erie 10.7MHz ceramic IF filter 0.25
(red dot - 10.70MHz center frequency) 3dB bandwidth
280 ±50 kHz, 20dB bandwidth of 650kHz, 6dB insertion
loss, 330 Ohm input/output impedance, the standard
for most stereo's and home receivers. Listed in the
Digikey catalog at $1.13 each and $61.50 per hundred.
If you take all 100, you can have them for $12.50.
(and with the 20% discount it would be $10 for 100)

25 KBF-455R-15A Kyocera 455kHz 6-POLE ceramic IF filter 3.00
455kHz ±1.5kHz center frequency. 6dB or all 25 for $62.50
bandwidth ±7.5kHz (ie. 15kHz), 50dB bandwidth of
±15kHz. 6dB maximum insertion loss, 1.5kOhm impedance.
These are triple units (ie. equivalent to 3 of the
standard 2-poles units like sell for $2.84 each
at www.digikey.com)

25 CFW455E Murata-Erie 455kHz 6-POLE ceramic IF filter 2.50
6dB bandwidth ±7.5kHz, 50dB bandwidth or all 25 for $50.00
±15kHz, 6dB maximum insertion loss, 1.5kOhm impedance.
(same bracketed note as with previous item)

2 SHORTED General Electric C50 110 Amp SCR's free with
Electrically they are useless, but you might minimum $75
be able to use the braid on them. They are purchase
also great to hold by the braid and then whip but you pay
a mugger over the head with! ;-) the shipping

10 Solitron Devices, SD10, Sounvister - NOISE ZENER's 2.
9V Zener diodes used as audio white noise sources in
audio equipment. Supplies with data sheet showing
individually tested noise outputs of 390 to 900
uV/20Khz @ 600 ohm, ordered by International
Rectifier (according to the data sheet) in 1975

1 Sigma Datacel # 301R2-24 optocoupler 4
with one lamp and two photoconductive cells

6 Clairex Photomod # CLM4012 optocoupler with one lamp 2
and one photoconductive cell with spec. sheets

31 DG180BP Dual SPST Very Low-Resistance (±10 ±) J-FET 6.
Low Distortion Analog Switches especially
suited to Video or Audio Switching purposes and precision
Sample and Holds, by Harris/Siliconix/Intersil list price
$20.20 U.S.! I have copies of the specs sheets for
you plus a summary of the data is at the end of this list
(FET switches unlike CMOS ones do not change resistance
with signal and so are extremely low distortion)
Or take all 31 for $110 minus 20% discount (= only $88)

50 2SC1254 Low-noise UHF-VHF NPN transistor TO-72 case 0.75
by NEC. 800 MHz minimum fT at 6mA, 50mA Ic max.
25 Vceo, 0.25 Watt

5 80180 TO-117 stud RF NPN transistor by MEC for CATV 1.25
amplfiers. 5 Watt Pd max., 250mA Ic max., 25 Vceo,
1500 MHz fT

2 Used Piezoelectric Ceramic Blocks with metalize 15.
ends. About 2" x 2" x 1 1/8". HEAVY

1 Double Disk converter/hole punch All metal construction 2.
Yes the original product in the original box for you
antique lovers! Now if you can just find 3.5" 720k disks ;-)

80 USED - Miniature lamp holders with 24/28 volt lamps 0.05
plus 16 spare bulbs

12 Appliance neon indicator lamps with internal resistor 0.40
3/8" x 1 1/4" rectangular hole

9 Appliance slide switch 3A@125VAC plus 0.50
neon indicator lamp with internal resistor
3/8" x 1 1/4" rectangular hole

200 Heat Shrink Tubing END CAPS (plastic plugged end) $6 per 100
Inside diameter before shrinking 1/8"
use to cap unused wires or insulate small splices

50 Panduit Female 1/4" disconnects crimp-connectors 0.10
(ie. solderless terminals) fully insulated
Blue for #14-#16 wire. For use on things such
as Solid State Relays that have 1/4" tabs.
Similar to ones made by Amp and by 3M.

48 Knobs for 1/8" shaft Raytheon pn TSA50-2WL-1 9/16" dia. 1.
x 7/16" high. Fluted black polycarbonate knob with
brass insert with one set screw, white line up the
side and brushed aluminum circle on top.

3 Alco black machined aluminum knob for 1/8" shaft 2.
with flat finger grip and thick aluminum skirt
numbered from 0 through 9

12 Various plastic knobs with set screws for 0.40
1/8" dia. shafts

12 Knobs for 1/4" shaft. 1 1/4" dia. x 5/8" high 1.
Fluted black ABS knob with aluminum insert with
two set screws, NO pointer, with brushed aluminum
circle on top.

3 Various machined aluminum knobs for 1/4" shaft 1.25

10 Large plastic knobs for 1/4" shaft with one set screw 0.40
Gold-coloured anodized alumimum cap, brown plastic
approx 2" in diameter and 5/8" deep

16 METAL foot switch with 2.5mm plug on 5' coaxial cord 5.00
meant for controling cassette tape recorder, but
contains SPDT 5A@250VAC micro-type momentary switch
so can be easily modified for other applications
rubber floor pad and non-slip white plastic foot grip

1 International Rectifier #J29B17 Selenium Full-Wave best offer
Bridge Rectifier. Plates 6" x 5" and 2" between the

outer-most plates. Center bolt length is 4.25" long
4 plates, 4 connections.

2 Xenon u-shaped # U-8538 flashtubes for low 5
speed (eg. photographic) use. Pt = 10 Watt.
Anode to Cathode voltage: 300 volts minimum,
400 volts nominal, 600 volts maximum. Operating
life at 10,000 flashes with a maximum energy of
100 Joules per flash at 6 flashes per minute
(eg. 1250uF capacitor charged to 400 V = 100J)
6kV (@ 0.8 mJ) trigger voltage. 45 mm high,
8mm dia. U-shaped tube.

3 Xenon small linear flashtubes designed for 2
higher speed use (data sheet uses the example
of a 30 Hz rate) Total length of about 1" long
Maximum Power input of 6 W.s., with an
operating life of 10,000,000 flashes with a
30 Hz flash rate and 0.2 Joules per flash.
Has attached trigger lead. With data sheet

10 Xenon small linear flashtubes designed for low 0.50
repeat rate (as for camera flash use)
has No attached trigger lead. About 1" long
No data sheets

1 Strobe - flashes from 1 to 6 times a second. 20
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. (This unit and
the one below are in Hammond 1591C Heavy Duty ABS
boxes with 1591AC clear lids. These boxes alone cost
over $7 US each.) Runs off of the
AC outlet and has internal fuse for protection.
Uses FILM capacitors (3.3 ΓF) for charge storage.
The first item that "blows" on strobes are the
Xenon flash tubes, the other major item is the
capacitor if cheap electrolytics are used rather than
film capacitors. Film capacitors also have much
lower ESR (effective series resistance} and so are
usually as bright as strobes using electrolytic
capacitors with 3 times the capacitance.
(2 Linear replacement Xenon tubes are available for
$1.50 each, but only with the purchase of the strobe.)

1 Strobe - flashes from 2.5 to 14 times a second. 35
Good for use in medium sized darkened room like a
rec room. Approx. 4 x 6 x 12 cm. plus the size of
the external fan that includes a finger protector.
(This unit built in a Hammond 1591 Heavy Duty ABS
box with 1591 AC clear lid.) Runs off of the AC
outlet and has internal fuse for protection.

Uses Film capacitor (3.3 µF) for charge storage.
Because it uses the same capacitance as the $20
unit, but flashes up to 2.5 times as often, it
delivers up to 2.5 times as much power to the
Flash Tube. Includes a built-in fan to increase
Xenon tube life as well as using a special tube
designed for higher speed/higher power flashing use.
(4 Linear replacement Xenon tubes with data sheet,
are available for $4 EACH, but only with the
purchase of the strobe.)
WARNING: prolonged exposure to higher flash rates
can produce nausea and even epileptic-like seizures
in some people who are NOT epileptic.

1 6 Digit mechanical counter with 6 Digit preset 4
PANEL MOUNT. With SPDT switch output - 93 Volt DC
One 93 VDC solenoid for counting and one for reset
(there is also a manual button for the reset)
could probably be powered by one of the
16VAC + 50 VAC listed below

1 ACE cylindrical key mechanical 7 pin lock 1
with 3 keys, for cabinet etc.,

16 25kΩ Linear 50mm-travel slide potentiometer 0.20
with centre detent - no 3mm mounting screws

Military Grade high-G shock resistant relays

1 USED Hi-G Inc. 26.5VDC 575Ω DPDT 2A contacts 1.50
20 x 10 x 10mm

25 x 31 x 15mm

4 Deutsch Inc. microsized 25.5VDC 1.3kΩ DPDT 4.
only 10 x 15 x 5mm!

FERRITES:

1200 Ferrite beads - About 0.1" long x 0.13" O.D., 100 for $5
believed to be #43 material. 1200 for $36

200 Ferrite core, cylindrical with two holes - (How I used 0.05
them was to put in a U-shaped piece of wire and use
them as radial mount RFI suppressors chokes for DC
power supply lines. Of course you can also use them

for baluns.) 0.25" long x 0.25" diameter.

32 768T188 Ferroxcube/Philips 0.5" OD x 0.28" ID .30
x 0.19" thick Toroid 3C8 material with 3 sets of
windings (very few turns and so easily removed
to use the cores) for on-board inverters
to provide negative supply

1 Solid ferrite block 4" X 2" X 1" 4.00
Has two corners mildly chipped
Unknown ferrite material type

2 Toroids Magnetics # 6T5320-S4 4.00
2 5/8" OD, 1 3/8" ID, 5/8" thick
Supermendur, High Flux density and temperature

6 Ferrite toroids 2" OD x 1.2" ID x 0.5" thick 2.50
Light blue in colour - no identification

6 Toroids Magnetics # 6T5233-D2-A4 black 1.50
1.55" OD x 0.9" ID x 0.45" thick

7 Toroids Magnetics # E53-55252-A2 violet 1.50
1.6" OD x 0.9" ID x 0.55" thick
Square Orthonal 50% nickel-iron alloy
2 are still wound with magnet wire

8 Toroids Magnetics # M65-55930-A2 violet 1.00
1.05" OD x 0.55" ID x 0.45" thick

8 Toroids 1.3" OD x 0.75" ID x 0.43" thick 1.00
Black - no identification

4 Prewound 4229 3B7 Philips Pot cores A250 set 3.00
with two winding both about #18 AWG wire
with PCB mounting and shielding can

4 Prewound 3010 3B7 Philips Pot cores ungapped 1.25
A7580 set with three #20 AWG and one finer winding
with PCB mounting and shielding can

4 U-cores 2 5/8" wide X 1 1/16" high x 9/16" thick 0.75
(67mm X 27mm X 14mm) of course you need a pair
of them to make a set and I do not have the
bobbin core for them. There is lots of room
for a high-voltage winding if you can wind one

2 Prewound E-core transformer #TLP6759 Mitsubishi 1.00
One centre-tapped primary and one secondary
appears to be a 1:1:7 for switcher
approx. 1 5/8" x 1 1/2" x 1/2"

4 set EC series 70 Ferrite E core. Total core pair size 10.00
is about 2.75" x 2.75" x 0.65". Each set includes

a pair of cores, a bobbin, U-bolt, and a metal base
plate. Four of the core halves are ungapped and
four have 0.19" gaps. These could either be
paired to make 4 sets with 0.19" gaps (for about
A90) or to make 2 ungapped sets and 2 sets with
a 0.38" gap (for about A55). Will be of Philips
3C80, 3C81 or 3C85 materials (all very similar)
Also included are a total of 3 spare bobbins in
case you make any winding errors if you buy all sets.

4 set EC series 52 E core. Total core pair size is about 4.00
2" x 2" x 0.55". Each set includes a pair of
cores, a bobbin, U-bolt but no base plate.
2 halves with no gap, 6 halves with 0.09" gaps.
So you can make 1 ungapped set and 3 with 0.18"
gaps, or 2 sets with 0.09" gaps (A105) and 2 sets
with 0.18" gaps (A65). Will be of Philips 3C80,
3C81 or 3C85 materials (all very similar). Also
included are a total of 3 spare bobbins in case
you make any winding errors if you buy all sets.

INDUCTORS:

Bag Of 28 minature audio toroids on 5/8" x 5/8" phenolic 14.00
mounting base. Various values from 10 to 500 mH

2 Used "Collins" MP-206-28B audio toroids 600 mH 2.00
1" dia. x 1/2" thick

1 Used Torotel audio toroid 240 mH 1"dia.x1/2" thick 1.50

1 Used Torotel audio toroid 360mH with tap 1.50
1" dia. x 1/2" thick

2 Used CAC audio toroids 4 H, 5/8" dia. x 3/8" thick 2.00

1 Encapsulated toroid by Hisonic believed to be .50
132uH - 1" dia x 1/2" thick

6 Encapsulated toroids by Torotel believed to be .50
180uH - 1" dia. x 1/2" thick

(Transformers are preferably for sale in the Toronto,
Canada area for pick-up, because of the cost of shipping heavy items
such as these, but if you are willing to pay for the shipping I will
send these anywhere.)

TRANSFORMERS (all 115VAC primaries except audio transformers):

3 50 Amp to 5 Amp (50-400Hz) CURRENT Transformer 12.50
The Simplex Co., Inc. 2 3/4"x 2 3/4" x 1 3/8"

MOTORS (or all 37 motors for $16 U.S.)

1 "MN-30 Micro Motor" by Tradeship (California) Inc 0.50
Open-framed 12 Volt DC 5 pole permanent magent hobby
motor at up to 18,000 r.p.m. 3/32" shaft with gear
about 2 1/4" long with mounts, 1/2" thick, 3/4" wide
graphice brushes. In original box

1 "MX-77 Micro Motor" by Tradeship (California) Inc 0.50
Open-framed 12 Volts DC 7 pole permanent magnet hobby
motor at up to 20,000 r.p.m. 3/32" shaft with gear
about 2 5/8" long with gear, 5/8" thick, 7/8" wide
graphite brushes. In orginal box

1 Sychron 20 r.p.m 24VAC 6Watt AC motor 0.50

6 3-12 VDC permanent magnet motors 0.50
body approx. 1" dia. X 1.5" long with 1/2" long
shaft. Has graphite brushes

4 108 VDC permanent magnet motors 7500 r.p.m. 0.25
full-load current of 0.08 amps. Rated for 105@C @
20 minutes. Body approx. 1" dia. X 1 3/8" long
with 3/16" long "d" shaft

3 USED pancake type 12 Volt stepper motors 0.25
removed from old floppy drives

1 USED cube style stepper motor from an old Hard Drive 0.25
body approx. 1.5" X 1.5" X 1" with gear on shaft
short 3/4" long leads

16 USED DC permanent magnet motors of various sizes 0.25
for 3 to 12 volts from tape recorders and a VCR
with pulleys on shafts

1 New stepper motor Rapid-syn model 20V-03L 6
Impedance protected. 6 leads. I can't "feel" the
step size. 2" dia. x 2 1/2" long body. Double
shafted 1/4" dia. x 1" long at both ends. Three
threaded mounting holes at one end - two at the other

1 Used stepper motor similar to above 20Volt 3
somewhat longer shafts. 6 leads with connector
Rapid-syn model 20V-01J. Looks like one end is

meant to fit into a 1.75" dia. hole, with a ridge
presumably for holding it in just above this.
"Feels" like it is 3.6° step size.

1 Stepper motor used from HD. 5 lead with connector 1
Astrosyn model # 17PS-c006-01. 1 5/8" x 1 5/8" x
1 1/4" body. 5mm dia. x 12mm long shaft.

1 Stepper motor - used. Nidec model #44F5098007 2.50
2" dia. x 7/8" deep body. With two rollers and
the matching belt to go with them.

Power resistor selection 35
Do you need power resistors for things like testing power
supplies or power amps? Here is selection of over 100
of them, from 0.15 ohm to 5600 ohms at up to 70 watts.
Also included are over 250 of the very hard to find tubular
power resistor mounting brackets.
(or with the 20% discount $28! plus shipping)

1 bag Over 250 power resistor mounting brackets
for 5 to 50 Watt tubular power resistors
1 0.15 Ohm 20 Watt power resistor
4 0.47 Ohm ADJUSTABLE 25 Watt power resistor
1 1 Ohm 50 Watt power resistor
1 1.2 Ohm 70 Watt power resistor
1 1.5 Ohm 35 Watt power resistor
1 1.5 Ohm 50 Watt power resistor
1 1.5 Ohm 63 Watt power resistor
8 2.0 Ohm 50 Watt power resistor
Great for audio and power supply dummy loads
1 2.0 Ohm 3% 50 Watt (metal encased)
1 2.0 Ohm 63 Watt power resistor
6 3.3 Ohm Dale RW21 series (at least 20 Watt)
(Same size as the Ohmite 4 Ohm 40 Watt resistors)
8 4 Ohm 5 Watt cement block type
2 4 Ohm 40 Watt power resistors by Ohmite
1 5.1 Ohm 5 Watt cement block type
2 6 Ohm 50 Watt power resistors
1 6 Ohm center-tapped 50 Watt power resistor
2 6.2 Ohm 5 Watt cement block type
2 7 Ohm 5 Watt cement block type
9 8 Ohm 5 Watt cement block type
8 10 Ohm 10 Watt cement block type
7 10 Ohm 20(?) Watt
2 12 Ohm 5 Watt cement block type
2 25 Ohm 3% 50 Watt metal encased
1 91 Ohm 5% 3 Watt resistor

Sounds like either the 1625 is shorted, (how much plate current?) or
the plate choke is open. Another possibility is that the rectifiers
in the plate supply are blown or their filament supply is missing
(thus no plate voltage) Either way, it probably happened as a result
of an arc inside the tube.

The 'front-end hardware for 'Weaver' is identical to the more traditional 'phasing' type of direct conversion topology. It's just a pair of balanced mixers (multipliers in function) fed with a quadrature phase LO. Only difference is that the LO in Weaver method is placed in the middle of the information band, vs at the carrier frequency for 'phasing' receivers. After that, it's just I and Q outputs that go into the DSP for processing. In the 'phasing' approach, the DSP performs a Hilbert transform (broadband 90 deg audio phase shift) on one of the inputs, puts a matching time delay on the other, and sums the two together to get cancellation of the unwanted sideband response. In the Weaver approach, the DSP performs another mathematical multiplication (mixing) process on the I and Q channels with a mathematically generated quadrature LO at the mid-channel frequency (approx 1.2 Khz for SSB). Since the DSP processing is mathematically generated, it is numerically perfect. The only source of non-mathematical variation or error is in the first set of mixers and LO phasing. This error only results is in 'aliasing' distortion inside the channel bandwidth, not degraded interference rejection from the opposite sideband as in the phasing method. Using DSP, it seems to me that the Weaver method is preferable for SSB, and maybe even CW work.

Source record: 67263

> Anybody know any links to pages describing how to use and the
> characteristics of, microwave over power transformers for
> amateur radio use.
> Neil
==========
There have been discussions on this NG on this topic before.

I tested a microwave oven transformer . Perhaps the unit is not in a A1 condition ,but after 45 minutes without any load the unit became very hot. There are also surface welds to keep laminates together .When I suggested that heat was due to eddy currents , a comment was made that welds were too superficial to be the cause of eddy currents causing this heat problem.
Some transformers are probably designed for a low duty cycle , hence perhaps not OK for Ham purposes.
Another aspect is the fact that 1 end of HV winding is bonded to the case and that make it floating might be unwise because of inadequate winding isolation.
Then it was mooted to go for 2 transformers giving 1 HV winding with centretap earth, but this gives a problem with a pulsating DC current also in the primary windings.

As far as I am concered the microwave oven transformer I have is no good for a HV power supply.

Uh-oh.

> So I looked at the output of the driver
>on the built in meter and saw that I was driving about 8 mA out to the
>1625. Just on a wild guess I'd say that that was too much.

That's way too much. 3.5 to 4 mA is about the max, and 2.5 to 3 will do the job
OK with most tubes.

Overdriving can causes all kinds of troubles, including destruction of the
final tube.

>So I left the
>light bulb plugged in and retuned by the instructions with the bulb instead
>of the dummy. Using 3 mA drive and tuning for best dip I was getting about
>80 watts on my meter and measuring the voltage at the antenna I was seeing

>with the bulb but way to little with the dummy. So I decided to build a new
>dummy based on a different design and use a watt meter barrowed from the
>local University.

I think one problem here is that you are making things way too complicated.

There is no need for a fancy wattmeter or dummy load with this kind of rig. A
light bulb dummyload is all you need. A 60 watter has an impedance of something
like 240 ohms at full brilliance, and the pinet in this rig will match that

with no sweat. Of course the settings of the plate and loading caps will be different when lighting a lamp than when feeding a 50 ohm antenna, but that is of no consequence.

Power output is easily judged by lamp brilliance. No need for wattmeters and such. Get a package of two 60 watt bulbs and another of two 40 watters. Put one of the 40 watters in a lamp near the rig and plug it into the 110. Use the other 40 watter for a dummy load. Comparing brightness will tell you the approximate power output. If the 40s burn too bright, use the 60s.

In addition, be very skeptical of the readings of electronic meters like DMMs when used around transmitters. Particularly hollow state rigs. There is RF all over the place, and it doesn't take much stray RF to give all sorts of goofy readings on electronic meters.

In this type of rig, you DO NOT just tune everything for maximum output. The output indicator is NOT the main thing to watch. Proper grid and plate currents, setting for the dip, and knowing that you are tuned to the right harmonic are the important things.

If you set the grid current to 3 mA and dip and load the plate current to the recommended 110 mA cathode current, a good 1625 with 700 volts on the plate will give you more than 40 watts of clean output in a rig of this type. That's pretty good.

> Well, even the best laid plans of mice and men go astray.
>Last night when I sat down to work out the relevant parameters as far as
>watts at dummy and bulb vs voltage output vs driver current and such the
>transmitter started acting strangly. Watts out started falling off and I
>could swear I heard a metalic "BING" noise coming from somewhere.

You zorched something. Sorry. Were you keying the rig for long periods of time while fiddling with the controls? That's really hard on components.

>Performance continued to fall off untill I got nothing at all. I tried
>changing out the 1625 and the 12BY7 and the OC3 and OD3 VR tubes but
>nothing help. At present this is what I'm seeing.
>
>1) I still get the driver current from the 12BY7 to work correctly so I
>know I'm driving the 1625.

By "driver current" I assume you mean "1625 grid current". If so, it probably means the oscillator section is OK.
>
>2) When I switch from TUNE to OP the OC3 tube stops glowing. The OD3 and
>the OC3 are in series with each other with the OD3 being grounded.

Let's back up a second and talk about the power supply and how this all works.

This rig uses an "economy" power supply, consisting of a 540 VAC 120 mA power transformer feeding a silicon diode bridge rectifier. This supply puts out about 700 volts from the high tap and 350 from the low tap, simultaneously. The high tap is used for the 1625 plate only. The low tap is used for the 12BY7

plate, and also run to a series string of VR tubes (0C3 and 0D3) which provide 255 volts and 150 volts at their taps. Dropping resistor for the VR string is a 5 K 10 W power resistor. The 255 volts is used for the 1625 screen, and the 150 volts is used for the 12BY7 screen.

The mode switch has 3 positions - "CAL", "TUNE", and "OP".

In CAL, the 12BY7 cathode circuit is closed and the 1625 cathode and screen circuits are opened. This is done so you can spot the transmitter signal with your receiver when using crystals.

In TUNE, the 12BY7 cathode circuit is closed and the 1625 cathode and screen circuits are grounded. This is done so you can set the driver tuning without applying too much power to the 1625. (With the screen grounded, the 1625 will draw very little plate current).

In OP, the 12BY7 and 1625 cathodes circuit are connected to the key jack and the 1625 screen circuit is connected to the 255 volts regulated. This is done so you can set the 1625 plate tuning and loading, and for normal operation. 1625 will draw very little plate current).

>When the
>mode switch is in the TUNE position I get 270v out of the OD3, which drives
>the 12BY7 and 375v out of the OC3 which drives the 1625. When I switch to
>OP I get 440v out of the OD3 and 450v out of the OC3.

There's something really odd going on here. First thing to do is recheck all the power supply wiring, the electrolyutic caps and power resistors, and the silicon diodes. CAUTION! HIGH VOLTAGE!! The electrolytics can hold a lethal charge for DAYS if there is no discharge path.

Get in the habit of unplugging the rig from the 110 before doing anything under the chassis. Then use an insulated screwdriver to short out each of the electrolytics. Then take your testmeter (with heavily insulated test leads, set to read DC volts) and carefully check for zero volts on all electrolytics and the high voltage points. The idea is to make absolutely sure that the rig is totally dead before getting in there with bare fingers.

Next step is to double check all of the wiring in the power supply, as well as the above-mentioned components. A resistor may have opened up, or a capacitor shorted, or a diode fried. A wire grounding the 0D3 may have opened up. Or one of the VRs may have turned to toast. It's also possible that the 1625 plate coupling capacitor (shown as .01 @ 1000 V) blew up. This cap should really be rated at 1.4 kV or more.

Next step is to remove the 1625 and 12BY7 tubes, power up, and see what the rig does. The VRs should never go out under any circumstances when the RF tubes are out of the rig. In addition, the voltages should read +255 and +150 on the two tubes' anodes. If not, you have power supply or wiring troubles.
>
>3) If I key the circuit when I have the mode switch in the OP position the
>OC3 will start to glow again and the volages fall off to a little below the
>TUNE posision readings.Switching to the 1625 plate reading on the internal

>meter shows that I'm getting about 120mA from the plate but no amount of
>fiddling with the tuning or load caps causes any effect, let alone a "dip"
>of any kind.

It sounds like something has opened up or shorted. A fried 1625 RF plate choke
or zapped plate cap will do what you describe. Check all the bypass caps, too,
for shorts with an ohmmeter. One of them may have shorted, too.
>
>Okay guys, what did I do now. I'm going to look at it all tonight, maybe
>just a short or open line somewhere?

The mode switch is another suspect.

The main thing is to try to get an understanding of how this deceptively simple
rig really works. There's a lot more going on in it than first meets the eye.

2502. Re: Where have all the builders gone?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-03 00:00:00 UTC
From: jjesson@ais.net
Message-ID: <rtGz3.2$Vb.50@news.ais.net>
Source record: 67323
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.shortwave

After running a communications shop and repairing and rebuilding National, Hallicrafters and other tube gear in the late 60's, designing and building receivers in the 70's and 80's, I feel I am certainly qualified as a builder and hardcore electronics experimenter. Software knowledge was gained over the years along with hardware knowledge through college and hands-on experimentation.

Anyway, I thought I discovered the GOLD MINE of experimenter delights when I first looked closely at NetMeeting first Version 2.11 and now 3.01... what a amazing product! Here is a list of both hardware and software projects... many of 'em current projects:

HARDWARE PROJECTS

- Design a 2.4 GHz Digital Video/Audio/Application Sharing Local NetMeeting Link (current project, 10MB)
- Build a Radio Controller Operated Remotely Through NetMeeting (many people sharing frequencies)
- Redesign Video Camera for Infrared Imaging (remove IR filter in from of CCD and add Visible light filter)
- Construct Fiber Optic Camera Lens and Adaptor
- Design and Build Performance Scope to look at Signal Eye Pattern
- Design and Build Data Constellation Scope (use fast external A/D Converter)
- Interface any Sensor for Remote Monitoring - Temp, Humidity, See Back Yard via NetMeeting CAM

SOFTWARE PROJECTS

- Write Radio Slow Scan Interface to NetMeeting API
- Write Control to allow Bandwidth Slider - Variable BW, Slow Scan to 30 Frames Per Second
- Collaborate on New Electronics Projects - Up to 8 HAMS!
- Collaborate on Circuit Simulations - Share Models in Real Time
- Create Virtual Special Interest Chat/Video Group Discussion

Just of few of my ideas for NetMeeting projects! A great communications tool... will lots of additional hardware and software components to be added... I have to get a web page up devoted to NetMeeting projects. The 2.4 GHz wireless link is built upon some Harris subsystems but you could design one from scratch. One of my favorite modern project resource is Circuit Cellar Magazine...

Thanks, Joe Jesson

2503. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-03 00:00:00 UTC

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

*rec.radio.broadcasting (devoted to the broadcast industry; moderated)*
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an
automobile accident; the future of this newsgroup is not known. 73 Bill...

Well, what can I say except the permitted nothing.
I am oppressed with restrictions and impositions.
Only your formulae and math.
Only your processes.
Naturally anyone's conclusion would be the same as yours under these conditions.
It is a wonder to me -now that I'm reduced to semantics- that any new discoveries can be made at
all, what with all the answers all known already.
So your challenge to me is to provide proof to you, using only your acceptable methods?
-Can't be done for just that reason.
And my statement requiring my proof according to you, really should be regarded as a stimulating
area of interest for you to pursue.
That is all it is for.
We are not on trial here in Kangaroo Courthouse.
Say I report having seen an UFO.
You want a print-out of mathematics to prove that I'm telling the truth, the authorities will want
third-degree cross-examinations and psychiatric evaluations, and so on.
In the meantime, some other country drops a bomb on us from a new type of aircraft which I could
not identify.
Sensible?
Re-reading my past postings will help to reduce the necessity for my repeating my arguments in the
general sense.

One plus one equals two every time?
So I know arithmetic.
Then they come and say I must learn math, then the "new" math, and algabra or algebra, calculus
dating all the way back to, did you say Archimedes?
Then Quantum mechanics, then Scalar physics.
Is that it finally?
Do we know everything there is to know?
Come on.
Your tone in this last letter is entirely posturing, as compared to your seeming interest at the
onset.
Is it peer pressure?

Not to worry.
Sometime soon, a new discovery will be announced.
Why haven't you already found it?

This is becoming tedious.
My statement stands as presented, and even if I'm corrected about eighty times when it is three, so
what.

Tell us (notice the process of bonding here) what you know about Barkhausen oscillations, and the
Caduceus (sp) coil.

Thank you for calling. *click*
Next!

Nostalgia, yep!
I don't know the song, but it sounds good.
As for the Pleiedians, better avoid them.
Andromedans are okay, but I don't mean Richard Hoagland's type.
I say, to the newbies, "wanna play 'chicken'?" .
You fellas in your Asian coupe, and us in our American Kings of the Road.
So I know what you write of, I had a Gonset transceiver also at one time.
RF gain and AF gain shafted together, is that the one?
Great set.

>|pinouts, crosses, etc...

>| SIG N8280A

The 8280 is a Signetics presettable BCD up counter, with up to 20 MHz clock frequency, consisting of a divide by 2 and divide by 5 counter.

The 8421 outputs are at pins 12, 2, 9 and 5 and the corresponding inputs at pins 11, 3, 10 and 4 respectively. Data strobe at pin 1 and reset at 13. Clock for the divide by 2 section is at pin 8 and clock for the divide by 5 at pin 5. Vcc and Gnd at the usual pins 14 and 7.

After reviewing my own comments, as well as the other responses, I'd like to throw out the idea of using the 'Weaver' method. The Weaver method has traditionally been regarded as a mtehod for generating and recovering SSB, but it is probably usable as a generalized HF receiver demodulator.
The beauty of the Weaver method, as I see it, is that responses due to signals outside the information bandwidth ('out of band') are inherently filtered out and do not rely on complex phase and amplitude balance in order to be rejected.

Consider how the Weaver method works:
A Weaver receiver is what I would call "Dual Direct Conversion".
In a first set of I/Q mixers, the LO frequency is inserted not at the carrier frequency, but in the middle of the information channel. For SSB with a nominal 2.4 khz BW, this means the LO is injected at 1.2 KHz above (or below, depending on which sideband contains the information) the carrier frequency, and the outputs of the two mixers are each processed by steep skirted 1.2 KHz lowpass filters. Voila! Any signals outside the information channel are instantly eliminated from the equation. Only remaing problem is that we have 'scrambled' the information we wanted to recover. In the case of a 2.4 khz SSB audio bandwidth, information that was originally in the range of 0-1200 hz is now at inverted at 1200-0 hz, and original information in the range 1200-2400 hz is now frequency shifted down to 0-1200 hz. The whole audio spectrum has been folded in half on top of itself and jamed into a 1200 hz bandwidth. Now comes the second half of the 'dual direct conversion process':
In a second set of I/Q mixers, the folded and scrambled audio spectrum is processed with a 1.2 khz quadrature LO, and the mixer outputs are summed. This process restores the folded 1.2 kHz spectrum to its original 2.4 kHz shape.

No complex wideband audio phase shifters were used in the entire process. Also, any imbalances in the phase or amplitude of the I/Q processes merely result in non-infinite suppression of the in-band components that were 'folded' back into the spectrum. This is distortion, not interference, and as long as it is 30 dB or so down it should be inaudible.

So, it seems to me that the Weaver method makes the process of building a direct conversion receiver more practical. With DSP lowpass filters after the first set of I/Q mixers, and a complete DSP implementation of the second I/Q process, many of the problems associated with hardware imperfections should be alleviated. The only 'fly in the ointment' that I can see is that AC circuit coupling will produce a small 'hole' in the frequency spectrum at mid-way in the audio band. For speech and CW reception, this will probably be in-audible. The only place I can see where it might be a problem is when trying to pass data information through the de-mod.

Comments?

I have two Jennings vacuum variables:

GCS-100 610-59
GCS-100 610-65

They are available for $100 each plus $10 insured shipping.

I also have a small box filled with small air variables of the type used for VHF and UHF - about 20 or 25 of them. Mostly from 5 to 100 pf. Many have never been installed in anything. $40 for the box full plus $8 insured shipping.

almost 20 years old IC202E/202S (and IC402) are still very popular at
VHF and microwave rallies in Europe, mainly because of low oscillator
noise, but has some distortion in TX and bad RX mixer, so it isn't as
good as it is expected to be, particularly not with a PA in urban
areas

a squelch circuit is usually made as an amplifier connected close to
the FM-detector output with simple bandpassfilter or tuned circuit for
a frequency above the audio band with a detector. The detector feeds a
transistor to switch of a part of the audio stage of the receiver.
When no signal is detected the squelch will be open. Most efficient
frequency is twice (or was it half?) IF filter bandwidth

Hi all,

I've got a collection of 6 Ghz Andrew fittings, flex, and so forth
I'd like to see put to a good use. All are new, some still in bags.
The collection consists primarily of CPR and CMR and maybe a UG or two.
The flex is 18" stuff. I've posted to a couple of other sites, but
apparently there's not much interest in that kind of hardware except for
maybe selling it as scrap. I suspect I have maybe 50-60 lbs of this
stuff. If you'd be interested in acquiring it drop me a note, either to
the address shown in header or to sam@wa4phy.dyndns.org. I need the
space it occupies in my workshop!

I'd appreciate a cc: of any followups due to my limited news reading
time.

Thanks...

>a relationship between the two that's consistant. Are these just reference or
>stock numbers, or is there a formular to use?

Some of those channels are full duplex. Channel 6 is simplex on 156.3,
but channel 26 is 157.3 ship, 161.9 shore.

For transmit, multiply the xtal by the multiplier. (Those repeating
final digits make me think that 9 would be a good guess). That works for
156.3/9 ~= 17.3666 (I suspect you got those two crossed up) and 157.3/9 ~=
17.47777 .

For receive, you have to offset the frequency by the intermediate
frequency. And then divide by some multiple to get the crystal frequency.
Looks like a first IF of 16.9 ????? MHz and a multiplier of 9.

Now, you do. That's all that matters.

>Some of the other guys
>have
>told me not to use the light bulb method because the reactance of the bulb is
>such
>an unknow and they might be right.

No, they are wrong, when we ar talking about this type of rig. Here's why:

Most "modern" rigs are designed to feed a 50 ohm resistive load, and don't take
kindly to anything that is much different.

But it was not always so. Rigs like this one can match all sorts of loads. This rig cannot match everything, but it can feed a common household lightbulb OK. The pinet in this rig has a much wider range than those found in later designs.

The reasons for the move away from wide-range pinets are several:

1) Smaller and cheaper components can be used.
2) Less chance of mistuning
3) Most hams were using coax feed with low SWR, and wide range matching was not needed.

> If I have a good known 50 ohm dummy load I
>should trust it. But, I don't know any hams, I saw a transmitter once when I
>was 15
>but I had now idea what it was all about. So when I key the rig and I see

>weeks ago I felt a thrill of discovery that I haven't felt in years. The rest
>of
>the guys might be right about trusting the meter and the dummy but I like the
>bulb.
>And as you say, on a rig like this dummy loads and meters may be a bit much.

We all know exactly what you are saying. My first rig was a single 6V6 xtal oscillator on 80 meters. Would light a 7-1/2 watt Xmas tree bulb to almost full brilliance. Made lots of QSOs with that rig - once I learned how to use it.
>

In CAL, there should be no 1625 plate or grid curent, because the cathode circuit is open. The meter should read zero.

Whoa, hold it right there.

Which plate has 150 VDC on it?

Go back and remover the 1625 and 12BY7 tubes and measure the DC voltages in the plate circuits as described. The 1625 plate cap should have 700 or so volts DC on it, key up or down.

>When I key the rig the voltage drops to 130v and I
>can
>just barely make out a small sine wave on the DC. I'm kind of assuming the

>with the voltages, I may have made a mistake with my tuning coil.

No, that's not right. The coil is probably pretty close to OK, but something else is wrong.

> I'm going
>to try
>and wrap a new one this weekend and see if that works. Does that plate
>voltage
>sound right to you?

Nope. Sounds like a bad plate RFC or a bad rectifier diode or both. Or a shorted cap in the plate circuit. Don't connect the scope directly to the tube plates - the voltages under normal operation are way too high.

Measure the DC plate volts with a DC meter and let us know what you find. 130 VDC on the 1625 plate is way too low.

73 de Jim, N2EY

When using the Weaver-method, you could (and should) halve the
bandwidth of the analogue filters. And since designing a good
post-mixer filter for a DC RX is non-trivial, I would suggest
deciding on Weaver vs. phasing before building everything.

Vincent.

You have to design a good filter in either case, so it doesn't affect the decision whether to use Weaver or DC. In both cases, the important consideration about the post-mixer filter is to provide a broadband termination to the mixer. This is the purpose of a good post-mixer diplexer.
If DSP is used to process the I & Q channels, then the analog lowpass filters only have to be good enough to prevent overload of the DSP from signals outside of the information bandwidth. As you pointed out, Weaver does have the advantage that the information bandwdth is 'folded in half', so the Weaver DSP only has to deal with half the input bandwidth compared to conventional phasing systems.

Since this is the place the Experts hang out, I have a tech question that I can't figure out. I have an old marine radio that's pretty sensitive. I was thinking of using it for a monitor, but I cant figure out the crystals. For example, channel 6, which is 156.3 mhz, the transmit crystal reads 15.48888 and the receive reads 17.36666. Channel 26, which is 157.3mhz, the transmit crystal reads 17.47777 and the receive reads 16.1111. There doesn't seem to be a relationship between the two that's consistant. Are these just reference or stock numbers, or is there a formular to use? Thanks in advance..........Craig..........Toecapp@AOL.COM

Thank you for the information. I did successfully extract the
S-parameters using a S-parameter two-port model from the book
"A Guide to Circuit Simulation & Analysis Using PSpice".

Can I also generate the noise figure parameters (Fmin,Gopt,Rn)
from Spice? The noise analysis of Spice covered in books doesn't seem
to shed light on how it can be done. Would you know where I may find
information on how these noise figure parameters are generated from
the Gummel-Poon model?

Craig,
As to the crystals - Transmit
17.366666 X 9 =156.3
17.477777 X 9= 157.3

As to the receive I don't know. The receive might be on different frequencies
that the transmit. It would help if you knew the IF frequency.

Hope this helps.

Michael

Source record: 67281

First, I think you have your TX and RX crystals mixed up. Second channel 6 and 26 are different in that 6 is simplex and 26 is duplex.

For receiving:
156.3 minus 16.9000 (IF) =139.400 (injection) / 9=15.48888.

For transmitting:
156.3 / 9=17.36666.

I am assuming you likely have a 16.9 MHz IF based on the crystals you mention.

Also channel 6 is simplex, while 26 is duplex (ship and shore different freqs) The ship is transmitting on 157.3 while the shore is 161.900 (your radios channel 26 receive) I did the math for those and got same results. That is why you did not see a relationship between the two channels.

2540. FS: QST Issues 1992 to Current $1.00ea

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-04 00:00:00 UTC
From: Andrew <xandrew@tropicom.net>
Message-ID: <37D17EB5.3C088BA8@tropicom.net>
Source record: 67283
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.space

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped) for 1 to 10 issues. If you
are interested in over 10 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the actual shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Feb & April - Dec $1.00 ea.
1994 Jan - Oct & Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea.
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=andrew45

2542. Spread spectrum digitized voice in the 960MHz (around there) band

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-05 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <7qt3lh$4ji@dfw-ixnews5.ix.netcom.com>
Source record: 67192

Have heard that some cordless phones in the 900MHz area are using digitized voice over spread spectrum, 1MHz wide spread. My company (which shall remain nameless) is making ICs that are transcievers on a chip, but only at the milliwatt level. Seems that we as hams could develop a new mode with these chips, and appications could also be packet as well as digitized voice. We'll need preamps and "linears" for these chips though.

Is spread specturm of 1MHz wide legal up in around 960MHz (forgive my forget-fullness on where the ham band exacly is, I'd look it up before operating though)?

2543. Transverter to FT-747GX

Hi,

any good ideas/links how to connect a transverter to Yaesu FT-747GX, which doesn't have any low power RF output nor separate RF input. Transverter is an old Microwave Modules' 144/28.

> onto 4CX400A?

No. The problem is back pressure. These kind of blowers are designed
to deliver a high volume of air with very low back pressure. Although
the 4CX400A only produces a relatively low back pressure, You will
need a blower deigned to deliver a relatively low volume with enough
back pressure for the tubes. Have a look at e.g. www.papst.de for
different kind of blowers usable for tube cooling.

> Should I shield it to prevent from being damaged by RF? Thanks.

I don't think this will be necessary. One solution might be to mount
the blower outside the RF compartment with a screen in between. You
will need an even stronger blower then, however (additional back
pressure due to the screen).

Hope this helps

2551. Tayloe Mixer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-05 00:00:00 UTC
From: Rocci <rocci@worldnet.att.net>
Message-ID: <37D2BD1F.A7942BE9@worldnet.att.net>
Source record: 67201

Has anyone done any work with the mixer circuit described in this link?:

http://www.extremezone.com/~ki7mn/tayloe.htm

It seems to me that this circuit, combined with some low noise op-amps, would provide a very high performance I/Q front-end for a phasing or Weaver type of receiver. Add a 4x local oscillator generated from a high frequency DDS, and a DSP 'backend', and it seems that one could build an almost 'all digital', all band receiver with an unlimited software-controlled feature set, on a post card size format.

Is anyone out there doing anything like this?

"WB" <willyacht@yahoo.com>
shared these priceless pearls of wisdom:

->I am looking to purchase some PCB design software, one thats easy to use,
->has a autorouter and has a good set of manuals for beginners.

I went through this iteration myself about a year ago, and after trying ALL of them, I finally decided on CircuitMaker and Traxmaker from Microcode. It isn't foolproof, but better than anything else I tried, and I tried about 20 of them.

Don't bother with the "Pro" version, it is just more money for very little additional performance.

Further refinements have been made in this general area by Tom Hornak
of Hewlett Packard Laboratories (now Agilent Technologies). If you
are interested, look at his recent patents. He has an additional patent
on a mixer in this class that is still pending. He has taken up this
basic concept, identified the major error sources, and figured out how
to virtually eliminate them.

Source record: 67207

Luke et al.--

As for books, any ARRL Handbook is a great resource. The more years, the better. The Handbooks will take you from basic DC and AC principles (resistance, power, capacitance, inductance, impedence, resonance, etc.) on all the way up through some very sophisticated concepts: digital modulation schemes, DSP, etc. ARRL and CQ magazine each publish lots of books. Have a look in the back of any recent issue.

Old QST issues, or the CD-ROM archives are great. Old CQ and 73 magazine issues also. Bill Orr's Radio Communications Handbook (I think that is the correct title, but not sure) is a good one, and there is a new edition recently out.

The web is a good resource, especially for projects, or for detailed info on a particular topic. Try these URLs:

http://www.mnsinc.com/bry/hamfiles.htm
http://www.ac6v.com
http://jehosophat.com/
http://hem2.passagen.se/sm0vpo/
http://uhavax.hartford.edu/disk$userdata/faculty/newsvhf/www/ham-www.html

All sorts of info there, and lots of links. Yep, Arnie Coro comes up with some cool projects, even cooler because they are simple and cheap, and yet they work!

Go to hamfests and look under the tables for old books and magazines. You might even join a local ham club, especially after you learn a little, having a real live person to explain things really helps. Best of luck to you!

Hey Tim,

You may want to take a look at the "K2RIW" type of VHF/UHF
amps, they used 4X150's on 2m and 432. Really slick screen protection
And control circuits. Just adjust the voltages to fit your "jug"..
I applied the above concepts to a 4-400 that I used for rtty and SSB
on 80-10m. I could run my SB-104A at 5 w, out on rtty and got about
300 watts outta the 4-400. Worked alot of europe and Africa with my
model 22 tty. (Then the kids were born... oh well)

Variations on this mixer have been around for years. I first heard of it as a "switched capacitor filter" in 1980. Another variation was (maybe still is) used in a commercial HF transceiver made in South Africa. See : J. D. K. West - COMSIG 1991 Proceedings. South African Symposium on Communications and
Signal Processing Published by IEEE, New York USA

More recently (February 1998), I had an article on "using a 4 phase switch as a direct SSB modulator" published in "Amateur Radio", (the magazine of the Wireless Institute of Australia). The article was been on the web for a while (without the AR editors permission - maybe I should get it someday ;-)

Anyway, have a look at http://ironbark.bendigo.latrobe.edu.au/~rice/ssb/ssb.html

Hi,

could someone please translate the following output of a filter design program into a real circuit? The filter is a parallel coupled bandpass filter, the output format is Touchstone. I suppose the CLIN ..... statements define coupled lines, the meaning of ZE, ZO, E and F is clear. How are the three coupled lines connected? Is the output of the first line (node 4) input of the second line? Have the lines to be connected directly i.e. not via 50 Ohm lines?

These transformers have a "shunt" in the core that makes them saturate easy.
Remove this shunt (it's usually just wedged tightly) and core losses should
drop and cool thing off.
Many folks have used these (i have not personally). QEX had an article a
couple years ago. I could look it up if interested.
Yes, the grounded end of the winding usually has little insulation so
operating it off ground takes some careful measurements and testing.

2573. Extending backup battery life?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-06 00:00:00 UTC
From: voicebox@dnai_dnai.com
Message-ID: <voicebox-0609990821110001@192.168.1.2>
Source record: 67219
Cross-posted to:
sci.electronics.repair,sci.electronics.basics,sci.electronics.design,sci.electronics.misc,rec.radio.amateur.homebrew

I have several devices around the house (plug-in clock; answering maching; etc.) that use a back-up battery (variously a 9v, 2 AA's, and 4 AA's) to keep the time and other parameters during a power-outage. The infurating thing is that thes batteries wear out regularly even when power is supplied (the device is plugged in); no charge circuit is provided to keep these batteries from running down.

Can I use a NiCd battery in these devices and keep it charged by connecting it to the internal power source via a resistor and, possibly, a blocking diode?

What parameters (i.e., mA charge rate) should I use when choosing the resistor and diode?

Thanks,
Dave

I have the following IF transformers for sale - please take them all as a lot - $15.00 plus postage - -

2 New in the box 85kc IF transformers - replacements for the BC453 Q5er.

4 new IF cans - only have a part number for them as marked on the top - G115A/G116A - slug adjusments top and bottom.

3 new IF cans - 1 - #22195, 2 -#22196 marked on top of cans. Cans dated 1944 and 1945.

Thats all I know about the cans. Most likely from military equipment replacement kits, Im sure someone will recognize and want them.

I had an alarm clock that ate 9 volt batteries aevery month or so, just to power the sensing circuit that lit an LED whenever the battery went dead. I reverse engineered the schematic enough to find a way to add a charging resistor from the rectified, but unfiltered part of the power supply (half wave), so that the net current through the battery was just very slightly charging rather than discharging, but since this current came in pulses, the battery low monitor still worked between pulses and lights (more dimly) if the battery voltage is low (or the battery is disconnected). I now change the battery every couple years on general principles but the low indicator has never come on. No rechargable battery necessary because the battery never discharges significantly. Unfortunately, I can not give you a general design that will accomplish this in any appliance. But in principle it is probably doable, and disappointing that the manufacturers have not already done it.

Depends on what you mean by "regularly". If properly designed, these devices should draw very little from the battery while AC power is applied. I typically change mine once a year. Now if you get lots of power outages then the batteries get used more.

The newest issue of _Electronics Now_ magazine (Oct99) describes a noise filter and compressor, based around Analog Devices SSM2000 noise attenuator IC.

I'm wondering if this would be useful for sideband work. Any thoughts on this? Besides maybe being used for cutting off the white noise while no one is on and I'm just listening, perhaps it could also be useful for weak signals?

Should be pretty straightforward, limit the charge current to a milliamp
or two - then the battery will not be overcharged or stressed (presume
power outs are infrequent enough to allow slow trickle charge when power
OK?).
The diode should only need to be an 1N4148 or similar, resistor power
should be small if charge current low.
But how long will NiCads last ? Probably only a couple of years max.
It's like the ones in phones I guess.
hope this helps
Neil

Do the devices draw current from the battery when the mains power is up?
If not, alkaline batteries should last at least five years, or even ten
if the ambient temperature doesn't get too high.

I've just seen a 1.5 volt lithium AA cell on the market. If it has the
long-life properties of the standard 3 volt chemistries, it should last
10 or more years. Or you could use a 3 volt lithium AA and dummy short
in place of a pair of AAs. Kodak used to make a 9v lithium, but quit
making it. I believe I've seen them again recently, though.

If the units are drawing current while operating, lithiums will give
longer service, but the rechargeable option might be better. However,
you'll have to choose the charge current very carefully. Unless the
charge current is very low (I believe about C/20 to C/50 is recommended
for this), a NiCd battery is likely to not last as long as an alkaline.
And at this charge rate, the battery will take a very long time to
recharge, if it ever does, after it's called upon to do its backup job.

Tim, I remember seeing a full blown schematic of a 4-1000, 80-10 meters amp in one of the ARRL Handbooks. It was a complete build it yourself project. I have not been able to locate the exact year, but I'm sure if you call or write to the ARRL they would be able to lead you in the right direction. Just a thought. Good Luck with your project.....Gary

I installed 108 ohms, an 8.2v zener, and a 9v NiCd in my GERRY baby
monitor so that it had a portable life of about 3 hours. Just right so
that our battery consunption went from one per week to none. This also
allowed me to use a regular battery if required (as long as the AC
adapter was not plugger in)
I liked the earlier post about the 4148 diode and keeping the current
below 1mA.. You will never get the spec AmpHour out of these schems
(because you are only charging ~65% of total). But battery elimenating
battery replacement is possible

Cliff,

American Technical Ceramics (http://www.atceramics.com)

AVX (http://www.avxcorp.com)

Johanson (http://www.johanson-caps.com/)

and Dielectric Laboratories (http://www.dilabs.com/) all make the parts you
probably need.

As to sources for small quantities, that may be a problem AVX and Johanson are
sold by AVNET (http://www.avnet.com). They might sell to you in small quantites
with a minimum order (probably $50).

A reasonable approach from the cost and longevity viewpoint might be to use
a charge controller for The battery in Ur application. MAXIM IC's of
Sunnyvale, Calif makes several with differing control approaches.
the MAX712 which stops the charge when the bat voltage is level during an
sample period, or by total time or temperature absolute and is sold for
about $3.09 or near that. it requires 3 low wattage resistors, and 3
capacitors of less than 35 v rating, a switch transistor(1 amp capability
or so), and a diode. It stops a rapid charge, then goes to trickle for a
settable time and then turns off completely until the voltage drops below a
settable point. At which time it repeats the cycle..

I put this into the wireless headphones I was using due to the high cost of
replacement 3 cell Ni-Cd s (flat cells). AS used in some cordless
telephones.

I was forgetting to remove the headphones from charge, and the Ni-Cd were
topping out on me..
Cost to convert both units was about $10. (less than the cost of 2
batteries) But then I had most of the the small parts in junk box or bins.
Used "dead bug" type layout and wiring.

Cant buy the Ni-Cds like that easily now due to the disposal problem. They
try to sell U NI-MH instead, well this MAX 712 doesn't care, will charge
them too, just as well..

There was a commercial phasing transmitter for the amateur market, Gonset comes to mind but it might have come from some other company, that did address this issue.

The carrier oscillator was at 9MHz, and they put a 9MHz crystal across the output of the balanced modulators, to improve carrier suppression. The circuit was shown in the QST review (early sixties) of the transmitter. I can't remember whether the rig used tubes or diodes in the balanced modulator, but the point of the simple suck-out crystal was to make carrier suppression less critical.

Of course, if you're talking about using the filter to suppress the carrier, there was an article in Ham Radio in 1974 or 75 for a simple IF chain of an SSB transceiver using TTL, linearized of course. It had no balanced moudlator, but relied on the home made crystal filter to remove the carrier. The whole thing seemed more like a novelty, that it could be done with TTL, but I could never tell whether the author was serious about no balanced modulator or simply glossed over it for the sake of the novelty of TTL. Actually, I was never certain how much beyond the thinking stage the article had gone.

Unfortunately constant trickle charging of small NiCads, even at maybe 1 or
2 mA, will actually effect their life. I have used them in domestic heating
controllers, and found that the effective capacity drops with time due to
the constant overcharge, and also some cells eventually fail due to
dendritic growth. The cell ends up shorting itself out. We used many tens of
thousands of small button cells (100mAhr) and found that some cells would
fail after maybe two years, even though the manufacturer would claim five
years. We then changed to alkalines which with proper circuit design, i.e.
no drain unless the mains failed, looked to be heading for five years of use

before changing.
So my advice would be to try and keep your NiCad charging current as low as possible.

Have you ever looked into how well alkalines last with a very tiny (say
.01 to .1 ma) continuous charge? Is there sometning about the
construction of alkalines that makes this a bad idea, like no vent and
possibility of rupture? What I am after i a charge current that just
barely exceeds the internal self discharge rate.

John, what kind of life are you wanting to get out of these batteries?
The self discharge rate on Alkalines is such that you should get one or
more years of service if there is no current being drawn. Lithium should
get you 10 years.

=====

That's just the problem! The devices AREN'T designed "properly". The
batteries run down several times a year because the power supply doesn't
trickle charge the batteries; it doesn't even supply power to the memory
device. The battery is the sole backup power for the memory device (in an
alarm clock and an answering machine, to give two examples) and uses up
several batteries (2-3) a year.

Hi all

I know it is not a homebrew, but I believe some people here may have put a few together. ZOOOOOee..

how good are they? good clean sound/signal on transmit. How good is receive. (clarity, noise). I a will be buying their new 2/6 all mode when they ship it (maybe), but I would like a kit to build and 6 meters would be very nice to have. When the wife gets her ticket we could use it betwixt work and home and around town. With a plethora of RS 202 units collecting static charges it could be interesting.
For free plans and info on solar oven's water and purifiers, that actually work, see<http://www.accessone.com/~sbcn/index.htm>

Marine radios generally use a 16.9 MHz IF for simplex and a 21.4 MHz IF for duplex (shore stations owned by the phone company). Some radios use these IF's for transmit as well because then you only need one crystal for each channel instead of separate transmit and receive crystals. Motorola uses 16.8 MHz for the IF.

You might be wondering why the IF is 16.9 MHz not 10.7 MHz. The original marine VHF radios 30 years ago used 10.7 MHz. However, there were some combinations of simplex and duplex channels which had a spacing of 5.35 MHz, or half the 10.7 MHz IF. Strong shore stations caused bad intermods in these situations. This was first discovered by Al Bennett (N6BFZ) of Konel. He asked about pricing of crystal filters for frequencies other than 10.7 and was told they were the same up to 17 MHz at which point they cost more. So he chose 16.9 MHz and eventually everyone else copied him (except Motorola who almost copied him). And now you know the rest of the story...

2610. List Of Stamp Applications [990907]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-07 00:00:00 UTC
From: cjX@hth.com
Message-ID: <37d52c38.50925184@news.sverige.net>
Source record: 67160
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 4 years later there are 150+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address

and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

=====

That's just the problem! The devices AREN'T designed "properly". The
batteries run down several times a year because the power supply doesn't
trickle charge the batteries. The battery is the sole backup power for the
memory device (in an alarm clock and an answering machine, to give two
examples) and uses up several batteries (2-3) a year, even though the a/c
power never fails.

I've often seen postings suggesting that SMA circuits are easier to work on than ordinary thru-the-board circuits. I'm about to find out, I guess.

I've got a Yaesu VX-1R that's showing serious deafness on the 2M band. It went out sailing with my daughter, and went into the drink when she dumped the boat. The plastic bag it was in leaked, and she transmitted on it before realizing it was wet. I dried it out and it seems to transmit OK on 2M and 440, and receives on 440, but it's now deaf as a post on 2M. Receives a 5W signal only if within 5 feet.

Yaesu "kindly" offered to repair it for $225. Note that new radios cost only $200 or so now, so I declined, and bought a new one instead. I just can't throw out anything electronic, however. I'm sure you all know the feeling. :) So I'm going to try to fix it. My best guess is that an RF-amp in the 2M front-end is blown. Hopefully nothing else.

Two questions, therefore:

- where do I get a heat gun appropriate for SMT work? I seem to recall Gary Coffman recomended a specific unit before. Other tools I might need or want?

- Will I be able to find replacement parts? I'm only familiar with standard components with leads as long as toothpicks. Does Yaesu sell replacement components? someone else?

Thanks for any advice.

I believe people have recommended the Weller portasol and similar butane-powered soldering irons which have hot-air blower attachments. These hot air blowers are advertised for shrinking heat-shrink tubing and not for soldering, as far as I can tell.

I have one of these (a PSI-100) and have some questions about SMD soldering also.

I have tried desoldering some parts from defunct pieces of consumer electronics, to get a feel for how much heat was required to melt the solder, etc. In at least one case, I noticed after removing a few chip parts that the circuit board itself had warped. !!!

And some items, like large-value SMD caps (yellow plastic), charred a bit before they would detach from the circuit board.

Before I launch into a large SMD project, I'd like to know a bit more about how to use the hot air source properly:

Do I need to measure the temperature at the exhaust? How critical is it?
Are some types of SMT devices not suitable for hot-air soldering? etc.

QST has run a series of "don't be afraid of SMD" articles with an associated small project. I'll definitely be
going back and re-reading those before I try anything more ambitious.

Thanks and 73

Apparently if the terminal voltage of an alkaline goes above about 1.65 V,
you get electrolysis happening, which produces gas. With no vent,
the cell may burst, or it may decide to slowly leak its strongly alkaline
electrolyte. Or it may just vent the gas, which is hydrogen, and
ultimately provide fuel for an explosion. Or the gas may dissipate,
but you're still drying out the cell by electrolyzing away its water,
so the cell will eventually fail.

So, if you really want to "trickle charge" an alkaline, you should use
a regulated voltage, and equalizing resistors to keep the voltage
evenly spread across the cells if they're in a series string. With
a 9 V battery, you can't do that, since the inter-cell connections
are internal.

But why try to trickle charge anyway? Alkalines still have most of
their capacity available after 5 years on the shelf, as long as no
current is drawn from them. I have several devices with 9V backup
batteries, and they virtually *never* need changing unless the AC power
has been off for many hours - and then only the clocks, which run an
oscillator from battery power.

It sounds like what you really need is to just prevent current from
being drawn from the backup battery while the AC supply is live.
In many cases, you should be able to do this with two diodes and
a resistor. One diode goes in series with one battery lead, and
allows discharge but not charge. The other diode is used to feed
power from the power supply to the point that the battery used to
provide power to, with a resistor to drop the voltage if necessary.
So now that point in the circuit can be supplied with power from
either the main power supply or the battery, whichever has the higher
voltage, without current feeding from one source to the other.

No drain from the battery in normal operation, but no worries about
charging the battery either. This is how these circuits should be
designed in the first place.

Dave

I never tried it, but with .1 ma. trickle, I doubt if
it would ever reach that 1.65v. I guess it would
depend on the size of the battery.

How would you know what the internal self discharge rate is? The best
answer really is to alter the circuit if you can to prevent current drain
whilst the mains is on. You can expect the batteries to last at least five
years as long as you don't keep having power failures, in fact you are more
likely to have problems from the battery contacts than the batteries, but
thats another story.

Very carefully? What sort of capacitance variation does one get with a couple thousandths of an inch tolerance on the pad spacing and width? How closely is the substrate dielectric constant maintained? I imagine the solder fillets don't matter a whole lot in this case, being behind the capacitor end metalization, but even things like the humidity and pressure of the surrounding air make some difference <not normally 1% but measurable>.

Cheers,
Tom

I have no perticular requirement, but was just wonderiing if anyone has
experience with how much the normal shelf life of alkaline cells might
be extended by trickle charging. If it could, say, double their
expected shelf life, they could very easily compete with lithiums where
a trickle is avaliable most of the time and long life is a requirement.

In the alarm clock I altered to trickle charge a 9V battery at about 3
microamp, the voltage equilibrates at bouut 9.56 volt (just checked to
make sure). But it is in a circuit that draws a continuous current and
my charger pulses in just a bit more on average than the drain, so it is
not strictly just charging, but cycling very shallowly. I have changed
this battery every few years, though it has never gone bad in service.

So is mine :)

Now with respect to the thread, Carl I agree with your comments regarding technology, keeping up, etc. I have built a couple one tubers for fun since I missed the days of tube rigs and wanted to get a taste of what it was. The biggest hurdle I see is that there was a time when you could build from scratch a rig that was commercial grade or close to it, if we look at the level of technology today it is near impossible for someone to just 'pick up' and start building using the current state of the art.

What I mean by this is, looking inside my radio today I see microprocessors, dsp's etc. and that's great but if I *really* want to build using state of the art chips I need to learn the current assembler or have a C compiler for the latest chip, I need a prom and or micro controller burner and the appropriate software much of which is specific to the controller or chip. I need to have boards etched to accommodate SMT parts because etching them and drilling them myself is beyond the capability of most homebrew PC board techniques, and even if I spend the money to invest in all this technology so I can further the state of my amateur homebrewing the chipsets I have purchased equipment for will be obsolete in a few years and I once again need to spend money to keep up. There was a time when one could have built from scratch a radio to match the quality of a Collins or other commercial grade radio, all you needed was the parts and a schematic. So in that time your building could have been state of the Art 'Collins' :)

Additionally, starting in this hobby as a Novice I've learned a whole lot over the years and just started hombrewing in the last 7 or 8 years I haven't the knowledge to build FT-1000 so I rely on existing schematics and available components none of which really use state of the art components so what else can I do?. I've built a few superhets using 602's but those of course are obsolete for all practical purposes. I'm just getting an understanding of mixing, LO's, VFO's so for now DSP's are a bit out of my league right now, but I'm trying.. While I'd love to understand the operation of all the chips in my Alinco DX-70 unless I'm somehow in the business the return on my invested time is very low. I think were

asking to much for radio amateurs to keep up with a technology that was once moving along with us but is now screaming ahead at light speed.

Your thoughts?

Sorry hit the send key by mistake. I don't have a lot of experience with this but I did have a similar situation where I did not have a chance to rinse the rig in fresh water before it dried, feeling gutsy I turned it on and found the radio acting really goofy after I gave it a good cleaning in fresh water and dried it it worked fine.

Whenever I find I have an unrealistic requirement like this, I consider it a sign that my design needs to be revised. Especially at the low end of this range, you won't find capacitors with anywhere near this tolerance. For one thing, it's extremely difficult to measure capacitors on the order of 1 pF with any accuracy due to fringing of the test probes of the test fixture (although I've done what I think was a reasonably good job of measuring down to a few tens of fF using microprobes and a very expensive self-zeroing HP impedance meter). Another problem is that traces to the capacitor and the body of the capacitor itself will typically have much more capacitance than a couple of percent of 1.5 pF. And these are likely to be not terribly stable, depending on the substrate material.

If I were you I'd take a careful look at my design to see what I've done to make this kind of tolerance necessary. If you're convinced you really need it, I think the only solution is variable capacitors, and keep the tweaking tool handy. Johanson makes some very nice small ones (9400 series). The smaller values are self-resonant at several GHz.

Source record: 67180

I have done quite a lot of rework / repair on surface mount boards and I do not recommend using hot air. It is far to easy to heat up too much and cause many other components to unsolder and move around on the board.

The next main concern is heating up to the point of DAMAGING the board itself.

For most rework, I use two soldering irons. They serve well enough in unsoldering most small components.

As for the multi-pin integrated circuits, it depends on how many pins. One can generally assume that unsoldering a surface mount IC will destroy the IC.

Given that assumption, I often go in with a fine tip wire cutter and cut the pins on the IC. This has to be done carefully for fear of placing too much mechanical stress and ripping the pin/pad right off of the board.

With all that having been said..... Yes, I do sometimes use hot air.

I use regular tin foil to cover all the components except the precise part I want to remove. Usually, I use two layers of tin foil to improve the thermal shielding over the parts.

With the tin foil in place, I use a hair dryer. First, I take a pair of tweezers with fine tips and a curve towards the end.

By sneaking the very tip of the tweezers under a lead or two of the part I want to remove, I "catch" the tweezers so that they rest on the curved part and cause a SLIGHT upward push on the part.

Then, I blow the hot air on the part, making sure to keep the tin foil down over all the other parts. Eventually, the solder melts, and the tweezers fall down, popping the part up off of the board.

Keep in mind, the part, tweezers, AND tin foil are hot enough to burn your hands.

I grab the outside tips of the tin foil and quickly move it off to another part of my test bench which is covered in metal and will not suffer from the hot metal resting on it.

Something to watch for is when the part pops off, and then the leads fall back and attach into the solder. I usually keep another pair of tweezers at hand, so I can reach into the hot air and GENTLY lift the part out.

Watch out, it is likely that some other parts have soft and/or melted solder and it is very easy to nudge them and they will shift off of their pad to create shorts and stuff.

As I said, hot air is a risky method.... I much prefer the two soldering irons in general.

The number one rule for wet electronics is GET THE BATTERY OUT IMMEDIATELY.

Corrosion is drastically slowed, and you have a chance to save it. If it was dunked in salt water, then rinse it in fresh, distilled if possible.

Then dry it out, use heat if available, but no more than say 110F or you risk warping the plastic.

Most electronics made is washed in water at the end of the assembly. It's de-ionized water, but it's still water.

One of the few tricks I know for SMT stuff is threading a thin wire behind
a row of pins, holding both ends of the wire, then pulling the loop of
wire through while the pins and solder are hot. Probably easier with hot
air but doable with an iron. It bends the pins a bit but the chips are
usually salvageable.

A number of people have suggested this. The radio was dunked in fresh water, which reduces the likelihood of salt bridges, but does not eliminate them completely. I'll go ahead with a dw rinse. Thanks. The gentleman who mentioned that the battery should be removed - yes, I did remove the battery ASAP.

Dear Mike, 73's.

This rig has already a squelch circuit. Don't you like it?
Please, tell me one thing: which is the transmitting range of your
TS140-S? For example, on 40 m band, which is the minimum transmitting
frequency?
The band limiting of my rig seems not to be OK...And, despite the fact I
have followed the manual instructions, the minimum TX frequency is much
less than 7 Mhz (precisely 6.5 MHz, where filter stops operating).

I have some modern Electronics Fundamental Text books
available. All are currently in use at various colleges.
They are all Associate Degree (Technician) level.

Electronic Principles by Malvino - 6th edition - 1999 - $ 30

Electric Circuit Fundamentals and Electronics Fundamentals
3rd edition by Floyd - 1995 - $ 30

Electronic Devices and Circuits by Hassul and Zimmerman -
Conventional Flow version - includes student workbook
I think this is a 1998 copyright, but it is still in shrink-wrap,
and I do not want to unwrap it to find out for sure. $ 30

Understanding Data Communications by Friend
The title says it all! $ 15

Understanding Communications Systems by Cannon
This one covers all sorts of communication systems -- not
just the data communications like the one above. $ 15

Modern Electronic Communications by Miller
Communications techniques, modulation, TV, antennas,
wave propagation, waveguides, fiber optics, noise,
2nd edition - 1983 - $ 15
3rd edition - 1988 - $ 18
4th edition - 1993 - $25

Intro to Digital Data Communications by Stein
Data formats, UARTs, RS-232, codes, telephone
systems, DTE/DCE interfaces, error detection, protocols,
multiplexing, packet switching, LANs $ 22

Digital Electronics by Uffenbeck
Covers from number systems to shift registers to Programmable
devices to interfacing $ 28

Electricity - Principles and Applications by Fowler
Part of McGraw Hill's "Basic Skills in Electricity and Electronics"
group of texts. Mainly theory, in easy to understand
explanations. $ 20

Prices do not include shipping from Florida. All books are
new. By the way, most of these are large, heavy books,
weighing about 6 pounds each, but can be shipped "Book
Rate" fairly inexpensively.

Yes, if data is coded to produce a null in its spectrum at that point,
or at DC if the first mix (baseband folding) which you refer to is
replaced by I/Q data, then the problem goes away.

The Weaver architecture also lends itself well to the insertion
of a mid-band pilot (the carrier, reinserted at a controlled level)
which can be used in the receiver (with proper additional signal
processing to eliminate the effects of the mobile multipath channel
at VHF/UHF, eliminating the "picket fencing" effect. This same

technique can be applied to data, with the result that denser signalling constellations (m-QAM) can be employed, even in the multipath environment, since the "unfading" (feedforward signal regeneraton) permits "breaking through" the "irreducible error rate" shelving effect that the mobile multipath channel would otherwise introduce. Additionally, the same hardware cane easily be adapted under software control (in a DSP preferably) to transmit and receive FM.

See US Patent 4,726,069 which I hold. It effectively describes the most flexible, powerful architecture for a multi-mode radio with advanced capabilities as well as the ability to do "traditional" modes.

73,

I respectfully disagree that the factors you mention above are
anything close to "show-stoppers."

> And you do have to worry about amplitude balance between the two
> paths to minimize audio aliasing.

One approach is to sample the IF, then use a Hilbert transform to
create the qquadrature channel. Thus, you have only one "LO"
and one "mixer" ...

> You also have to consider that if you are building a simple
receiver,
> you can probably use a CB radio IF filter to do the SSB so why

microprocessor
> xtals.

Let me see you build a linear phase filter with a cutoff of 1800
dB/octave
using microprocessor crystals ... in DSP it takes some care in dealing
with quantization effects, roundoff, etc. but it's doable ... in the
analog
```

domain, forget it.

> Another isse, is: what are you going to do on xmit? If you use the
> Weaver system there, you have the whistle problem.

The "whistle problem" can be esily turned into an advantage,
using the carrier, inserted at a controlled level as a pilot tone
for feedforward signal regeneration ... providing AFC, doppler
tracking, and removing the effects of the "fast fading" caused
by the mobile multipath channel at VHF/UHF ... see
US Patent 4,726,069 as referenced in a previous post.

Your reference to the carrier supression problems which "killed
the phasing method" are real WRT completely analog implementations.
However, in the digital domain, such things don't present nearly the
difficulty they do in the analog domain.

The point is to digitize, THEN filter ... in DSP ... as long as the
sample rate is adequate, you can change bandwiths at will.

Need more clues. I found 21 patents by Thomas Hornak; the most recent seem
to deal with photoelectronic stuff. Maybe I'm just not used to reading
patent text, but I couldn't identify anything similar in concept to the
description I read of the Tayloe mixer.

I've forgotten something ... what's this about needing two of the
microwave transformers? Is this assuming needing a split supply for
the linear (which likely does need split)?

(My application for high voltage is a TWT I found, which is also a
linear, tubular amplifier, but doesn't require split power.)

Because one end of the HV secondary is grounded to the core,
using 2 transformers is effectively the same as a center
tapped transformer. Use series diode in each high side for
full wave rectification. If only one is used the best you
could hope for is a single diode half wave circuit - not
good.

What sort of help are you looking for? You really should get the data sheet from Motorola, and application note AN980 is about using it. The data sheet does include a circuit board layout for a prototyping with the IC. Since the information comes from the manufacturer of the IC, it should be the best source, though I suppose there could be errors. The IC is meant for narrow-band FM, so it's not like you have to experiment to get it to work in that application.

QST for February 1999 has an article about a 2Meter receiver using the MC13135 which appears to be just a later version of the IC. The article might prove helpful, since it uses the IC in a synthesized receiver.

The author does mention that the IC's first mixer is a Gilbert Cell mixer (ie the sort of mixer circuit used in the NE602 or the MC1496) and that "These mixers have a low third-order intercept. This limits the receiver's large-signal-handling performance". This would apply to the MC3362, though I'm not sure if he's mentioning it in passing or if he actually found it a problem. If it turns out ot be a problem, one could simply change to a front end made up of discrete components, since the mixer/oscillator in the MC3362 stands alone from the rest of the IC.

I've never used it. The MC3362 must be similar to the MC3359 etc doulbe conversion If Strips, except it adds a first mixer and local oscillator. And the MC3359 is found in all kinds of equipment. So the design must be fairly standardized and provide fair performance.

I don't know how useful I've been (and I lost a few days when the ISP here
suddenly turned off shell access without telling anyone), but I've enjoyed
this thread.

You've been asking for help, unlike a lot of questions where someone
simply wants information. You've kept at it, when a lot of people stop
with one post, or continue it in email when someone bites. You've also
supplied detail, rather than a vague "it doesn't work". Some of the learning
comes with takign that detail and interpreting it, but a lot of people
wouldn't bother with the detail.

As Jim says, we all make mistakes at the beginning. More important, if
we hadn't made those mistakes, we wouldn't have moved forward. I always
assume that more people read a newsgroup than actually post, so perhaps
as you ask for advice others will benefit.

The truth is, I've barely used tubes, and that was a long time ago. I
got into the hobby as tubes were fading out. SOme of my comments
have come from observation, that I could probably make them for any
topic if someone provided the detail you do. But I've also learned
a bit as I look at the schematic and think about your comments.

But a ham using a conventional receiver is going to hear a whistle.

Doing everything digitally limits your dynamic range to 12 to 14 bits
or as we analog dinosaurs would say 74 to 86 dB. You might need more

dynamic range than that on the air. And that is why we don't do everything digitally.

> and the radio/tone decoder? (It's an old laptop btw.) Thanks.

Shawn,

I just did the send part of this with a program called Super Morse.
It, however, has info telling which pins on the serial port are used to
send and receive CW (it doesn't receive very well, but I don't care).
Without documenatation, you'll have to set it up to send then with a meter
see where it is coming out. My guess is it will be one of the control
lines.
Then you'll need to put it into receive mode and feed RS-232 levels into
control inputs from a key or keyer to find which line receives. You need
a circuit which converts the decoder (I assume this is the PIC & LCD
decoder by the fella from Italy) to RS-232 levels. These are plus and
minus 7 to 12 volts. For the control inputs the "mark" can be either the
plus voltage or the minus voltage depending on the software. On mine, the
software allows selecting either polarity.
There's a shareware for Mac called MultiMode which has full info. I
assume there are many others for the PC which are available on the Net
which have documentation.

You might also post the name of the program and see if anyone has info

Carl R. Stevenson <wa6vse@fast.net> wrote:
>SMT (surface mount technology) isn't any harder to work
>with than through-hole parts ... it just takes different tools
>(not a fortune in them, either) and different techniques.

That is true. Now, let me describe this neat little problem
and muse a bit over how to solve it. I have been building circuits
for around 40 years and am glad to be old enough to appreciate how
far we have come. As a person who is blind, I don't read schematics,
but it is possible to build some pretty neat stuff these days with
IC's, perph board, and judicious use of wire-wrapping and soldering.
As I mentioned several months ago in a thread about home brewing, I
usually solder the wire to components that have round leads because it
sure won't stay any other way. I use a Wahl cordless soldering gun
with the thinest tip they make as it heats up very fast and hot.

I can even do point-to-point wiring on IC sockets that have
.1-inch centers if I hold my mouth right and work carefully and
slowly, but I honestly don't know what to do about surface-mount IC's.
I am not ranting, here, because I don't believe surface mount IC's
represent anything but an attempt to make manufacturing easier,
cheaper, and smaller, but the spacing between the leads is so small
that it just feels like ridges along the edge of the chip and one's
finger nail could easily bounce over two or three while trying to
count.

I have seen adapters such as those used to adapt a 52-pin PLCC
to through-hole design such as one might use in building a 68HC11
project, but these sockets are expensive and only seem to come in
certain common sizes. There seem to be tons of different footprints
and numbers of pins in surface-mount IC's. They definitely don't all
look alike so it is going to require several different styles of base.

When thinking about this problem, some ideas come to mind. I
know that anything to do with microscopes, magnifying glasses, etc is
completely out of the question. Some other things are maybe possible.
Let's say one had a piece of circuit board with the SM footprint on it
and conductors going to some kind of header. It should be possible to
use electrical continuity to tell when the chip is resting squarely on
the right bed. Then, you have this magic glue:-) that doesn't stick
until you have moved everything around and are satisfied with it.
Then you do something like heat it to activate it and it doesn't flow
any conductive material between the pins to cause bridges.

I have heard some real-life examples that sound pretty strange. One case I know of involved a repair to a cam corder. The technician removed the bad chip and put the new chip in by first flowing solder over each edge of the surface-mount chip until every pin was soldered together. Then, he took very fine solder wick and wicked up the solder between pins. Of course, that was a magnifying glass job, but the point is that there are lots of unorthodox ways to work with these chips and I hope I find something that will work because I would really hate to not be able to build anything out of new parts some day.

I definitely agree with those that say that these are the golden days of home construction. I mentioned not reading schematics, but the more or less standard IC's such as logic chips and amplifiers allow one to build fairly sophisticated circuits by just knowing what signals and components are supposed to connect to each pin. The circuit sort of builds itself if you know what you want it to do and also keep in mind the electrical limitations of the IC so as not to fry it.

Back in the sixties and early seventies, it was not as easy to build circuits without a schematic because one had to manually do so much more just to get a simple amplifier or oscillator.

The last project I finished and got working was an audio peak-level alarm using a TLO64 quad op-amp, a LM339 voltage comparator chip, and a NE556 timer chip to produce the alarm tone which fed one of those piezo sounder disks which I stuck to the bottom of the chassis box the circuit is mounted in. I couldn't possibly have built this device and had it work as well as it does had I not been able to stand on the shoulders of the engineers who made the chips, so to speak.

True, but there can be some advantages ... potentially significant
ones.

Most hams want sharp filters that eliminate adjacent channel
interference.
I simply stated something that's quite a bit better than can be done
in the
analog domain, yet is quite doable in the digital domain.

> >> Another isse, is: what are you going to do on xmit? If you use

The carrier will normally be suppressed ... if the 2nd I/Q mix and
combining in the TX is done in the digital domain (before the DAC)
it can be followed by a digital notch filter to eliminate it even
further,
certainly to the point of inaudibility.

> everything digitally.

With all due respect, popycock. There are 16-24 bit stereo codecs
with sample rates adequate for CD quality audio (and the two channels
are simultaneous sampling, so they would work well for digitizing I/Q
baseband. The sample rates are high enough to allow simple
anti-aliasing
filters. Adequate dynamic range can be achieved.

The problem is that with a typical 2000V secondary, you're heading for about 6kV off load! Also the ripple is a 2:1 variation between alternate half-cycles, and I'd hate to think what the regulation would be with the high-resistance secondary winding that is typical of oven transformers.

Come to think, you could get back down to 3kV by using two identical transformers with secondaries in parallel and primaries in series, but that still leaves the ripple problem.

Unfortunately you still only have half-wave performance from each transformer, because there is DC flowing through each winding. It isn't like a true full-wave center-tapped transformer with both opposing windings on the same core.

Source record: 67123

Since posting a request a few weeks ago regarding underwater comms, i have been told to use ultrasonics.

I need to know if anybody has come across a (cheap) set of transducers (or even a complete system) that can pass messages upto around 200 yards or so.

I cannot use normal echosounder transducers because of size, weight and frequency (possibly interfere with on-board sounder(s)). There is also the fact that i do not need the same amount of power as this system covers a much shorter distance and is one way communications.

I also need a source of a box to house the electronics and a small(ish) rechargeable battery. I was thinking about a battery no bigger than the ones used in alarm systems. Either that or 4 off 'D' size rechargeables. The box needs to be watertight to a depth of a couple of hundred feet maximum (normally around 100 - 120 feet)....

The box needs to hold the battery, small PCB (about 2"x3") and the transducer (mounted externally).
I also need an external waterproof connector so i can recharge the batteries easily, rather than unscrewing the box to remove them.

Anyone any ideas?
All help greatly appreciated.

Steve

>the linear (which likely does need split)?
>Bill N1VUX

Do not use two transformers.
Either use a voltage doubler or a full wave bridge.
You will have to isolate the grounded side of the secondary,
for a full wave bridge recitfier and make sure it is well
insulated.
The use of two transformers in a full-wave center-tap configuration
will cause the core to saturate due to the DC current on the secondary
of the transformer. The Average DC current flowing in the secondary
needs to be near zero.

Source record: 67128

I am about to build an audio notch filter to remove the PL
tone frequency from the output of a receiver. I was going to use a
Butterworth circuit based on a good series in the July 1980 "QST" when
I thought it might be a good time to try a SCF IC as the filter
block. Is there a particularly good switched capacitance filter IC
that is easy to find, relatively cheap and available in a through-hole
DIP package?

It is my understanding that one doesn't have to do much except
supply a clock frequency of 8 or 10 times the frequency of interest to
make the SCF do its thing. The one disadvantage to the Butterworth
design is that you have to tweak things a bit to tune it in and it is,
therefore, a little harder to duplicate.

Not sure if you can get them from Motorola but DC Kits can supply MC145170 PLL chips each and they will allow you to charge this to your credit card. Send some email to Gary Clifton (clifton@dckits.com) and he will be able to give you some pricing details.

Note that I have no association with DC Kits but I have purchased their EXP-1 PLL experimenters kit and have been very pleased with their email support for non-US customers.

> QST for February 1999 has an article about a 2Meter receiver using the
> MC13135 which appears to be just a later version of the IC.

Information about this receiver is available on the web at
http://www.sonic.net/~shageman/2_meter.html This is not the complete
QST article but provides extra information and some component sourcing
notes. It seems to be a good example of using the MC13135 and MC145170
PLL to build a receiver.

If you are interested in getting started with the MC145170 and don't
want the hassle of programming a PIC you can download my free MC145170
programming software for your PC from http://www.qsl.net/zl1wjq

My model of TS-140 the squelch only works in FM mode. I'm not sure if all models are that way or not. There is a mod for freq. exp. on the 140, done by removing a diode on the control board.

2694. Reading a .wav file

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-10 00:00:00 UTC
From: wb5agz@dc.cis.okstate.edu
Message-ID: <7r9s9t$637$1@lotus.onenet.net>
Source record: 67044

What is the name of the document on Microsoft's web site or,
for that mater, any good document that explains how a .wav file is put
together? I want to try my hand at being able to do a byte-by-byte
analysis of a sound recording. I soon realized that I could find the
data portion, but I wasn't seeing what one would normally expect to
see, even taking in to account that these are at least 14-bit samples.
I know that 8-bit A/D converters used in audio or any application that
handles AC signals must be biased at half their maximum value or hex
80 in order to track the whole wave form. The recording I was playing
with was a recording of CW on a quiet background so one should see a
little idling at first then a sine wave sequence during each tone. I
saw nothing that looked obvious after the plain text "data" header.

All I know about the header is that it sets the sample rate
and whether or not the data are to be encoded and decoded as mono or
stereo. This file is mono. Not sure about the sample rate, but all
that would do is squeeze the data points together or spread them out
depending upon how many samples are being taken per second.

Thanks for any constructive ideas.

Hi Wes,
Unless he measures them himself I'd suggest a using trimmer.
1 to 2 % is pretty tight tolerence for small value caps.
For small quanities many manufacturers will send samples if asked.
How's life in the desert ? Bobby

You can find the position of the sats from Norad keps via Nasa or
other source, a tracking program like Nova For Windows will keep
your antennas pointed in the right direction or tell you where to point.
That's the easy part. The hard, they are encrypted. Bobby

Get a copy of SOX (Sound Exchange), it should be on Simtel. It comes
with source code and converts all sorts of sound file from one format
to another. You should be able to lift bits of the code for your own
use, or simply convert to raw data.

2699. Re: Microwave Oven Transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-10 00:00:00 UTC
From: Mike Willis <M.J.Willis@rl.ac.uk>
Message-ID: <37D8B4CF.A18F2227@rl.ac.uk>
Source record: 67049

All these problems with the secondary to frame resistance of microwave transformers can be solved by mounting the transformer on an insulator good for (say) 4kV. The problem then moves to the secondary to mains insulation. This should be good enough but one can always use an isolating transformer.

Most microwave oven transformers are designed for voltage doubling, but not with any significant load capacitance, just 1 or 2 uF. They are unlikely to work well with higher capacitance. They will also run hot. They are designed to. A blower may help cool them down.

How do we know DC will saturate the core in a centre tap biphase ? If it does, does that mean a microwave oven transformer can be used as a swinging choke ?

The last time I found parts for a project I was building, a nice new case and chassis, was here on this group and it was listed in eBay. If the message had not appeared here I would have missed the listing on eBay, as I don't have time to spend hours looking through all the stuff listed on eBay.

If you don't want to look at listings like this, simply filter all messages with FA in the subject line. That's why I put it there, which is the accepted method of posting.

I found the source to the Linux wavplay application to be useful
for this. Have a look on any Linux site (http://metalab.unc.edu
is a good place to start) under applications that relate to sound.

Hello,
I am looking for some information on designing VHF / UHF
valve (Tube) Power amps.
I would like to know how do you define the size of the strip lines
for the input and output circuits ?
and also how do to come up with the size for tuning "flapper"
capacitor elements ?

There must be some formula for calculating these or is it trial
and error !!

Many thanks Martin G1GYC

Thanks to everyone. I got the sox utility and will now go for
the .wav play utility. I think .wav files are the only file format
that sox doesn't cover. It does cover some older Soundblaster formats
and the audio format of the Sun work station which is the input and
output of an ISDN telephone subscriber chip such as what one would
have in an ISDN telephone. I suspect I will be quite busy for a long
time.:-)

Hi all, I write as to enquire if any one knows
of a kit of parts
or a built unit
or a schematic diagram
or ANY suggestions for a incoming power / RF meter,
for a blind (total) operator.
He needs something, so as to read incoming power 5 + ???
Some thing that bleeps with ether a change of tone or
preferably pips as in 1 pip to 9 pips ?
Maybe a press button, and it gives you the required info.
As any one ever heard of such a device.
Does any one know how the meter in a (normal)
Rig, is it driven ? Is it by DC ? Or RF ?
Apologies ! ! !
If I Haven't, explained my self properly.
ANY help would be VERY appreciated.
We have been trying,
to work something out for this chap for years.
You are welcome to e-mail me with any suggestions.
Or any one in N / West UK want to do a joint effort ??
On this very useful project
Thanks in advance from Bob

Bob couldn"t you use one of the led drives that are in
portables to indicate rec power and use the drive out puts to
drive a fet audio osc of varing tones to indicate the level.
Some of those chips have the option to turn on only one led
at a time thus only one osc at a time. Just one idea any way.

The 500 Hz filter has the better shape factor!

Hello,
Has anyone heard of a Cobra Curve Tracer ? Model CT-751
It is a small box with 3 switches- on/off, gain-junction-leakage,
calibrate,b-e, b-c
a socket for a transister under test, and 3 leads red , black, yellow.
and a place to hook it to the vert & horz. on a scope.
It says it was made in Polaris ,NY which I can't find on any map.
Does anyone know of this device . I have hooked it up and it sames to
work fine but I would like more info on it.
Also as if you couldn't tell it is rather old.
I would be greatful for any help.
Thank you.
Jeff

I think it was National years ago that had very professional datasheets for WOM (write only memories), and non-inverting gates that were drawn as just wires connecting the inputs to the outputs.

I though the idea was to run both transformers as full wave doublers,
(like they are in the ovens), but to swap the phase of one primary, so
that the ripple is reduced. You need a couple more diodes (in an oven the
magnetron acts as one of them) and another capacitor. But if you've dug
up two ovens, getting a couple more for the parts shouldn't be a problem
and transformer matching shouldn't be as critial.

If I'm using the correct terminology, they are still half-wave doublers in the ovens. Whatever you call them, it's a smart idea to use two transformers cross-phased, to avoid the problem of alternating large and small charging pulses. Using two transformers with the primaries in series but cross-phased, you might be able to get 2-3kV that is needed for a small RF power amplifier.

However, the main problem is still voltage regulation. In an oven, it is essential to limit the current through the magnetron (which is only a diode, with no control grid). This is achieved partly by the magnetic shunt in the transformer and partly by using very low values for the capacitors, typically only 1-2uF. Being current-limited means that the voltage regulation is very poor, but that's OK for the intended application.

The secondary resistance of the transformer can be quite high, and with the half-wave voltage doubler you don't have to insulate the start of the secondary winding from the core. Both of these make the transformer cheaper.

The power supply for an RF amplifier is very different - here you ideally need constant voltage. That means much higher values of capacitance (typically 20-30uF) and a transformer that has no magnetic shunt and a much lower secondary resistance. Also, the voltage regulation of a voltage doubler depends very critically on the secondary resistance of the transformer being very low. This is *much* more

important for any kind of doubler than it is for conventional bridge or full-wave rectifiers. All these factors means that - whichever circuit you use - you can't expect oven transformers to perform well in RF power amplifiers rated at more than a few hundred watts.

It's hard to generalize, but I think it's probably better either to use two transformers in a full-wave circuit (and accept that both cores will run closer to saturation), or to live dangerously and use a bridge circuit with the inner end of the secondary winding lifted from the core, than it is to use any kind of voltage doubler.

Gary the TS 530S is a good rig, it is economy version of TS 830S .. most parts can be replaced with generic parts, some would be hard to find ,fortunately you would probably never need any parts other than tubes and they will be available forever I suppose.. to my knowledge there are no weak areas or likely failures. if the digital readout failed I doubt that you would ever find one. the rig would still be usable without readout.I was once an authorized Kenwood Service tech.. I would not hesitate to run a TS 530 ,it`s one of the "good ones"old but good. good luck Harold W4PQW

My favorite part of the WOM data sheet was the number-of-remaining-pins
vs. number-of-socket-insertions graph.

Back when I first went to work for Tektronix, the draftsman could still
put a cartoon here and there on a schematic to end up in the manual. But
all humor disappeared when the engineer founder relinquished control of
the company to the bean counters.

In addition to the "cute" specs you describe, National Semiconductor also had a very real product titled "Damn Fast Buffer Amplifier".

Product families at the time ran something like "Buffer Amplifiers" and "Fast Buffer Amplifiers". Creation of a new, much higher performance device forced them to choose a new adjective to describe it's general performance. "Ultra" wasn't in use in those days.

No. The accepted method of posting is to post it in a newsgroup where the
charter allows it, and not to post it in newsgroups where charter forbids.
Unless your definition of "accepted" is "whatever Bill Clarke wants" (and
it probably is).

Ah, The spammer chant; "if you don't want to see it, don't look."

> Still all in all, he has a point. There is a NG for selling stuff and
> proper net etiquette would be to post FS items there.

Don't bother the spammers. Things like etiquette and rules only get in
their way. Playing nicely with others doesn't get them what they want.

Signetics had the 9046-by-N write-only memory. Wish I still had my copy
of the datasheet.

Electro-Voice had a spoof about some enormous hi-fi speaker systems. One
part of it said each speaker was shipped unassembled in two boxcars. An
accessory offering was a kit that let you convert the boxcars into a
summer home.

2737. Re: nead hel for blind opperaitor

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-11 00:00:00 UTC
From: wb5agz@dc.cis.okstate.edu
Message-ID: <7rdjr5$jh4$1@lotus.onenet.net>
Source record: 67079

There have been many good tuning aid designs for blind hams for literally decades. The first one I saw was on a DX 100 which was at the Oklahoma School for the Blind in 1964 or so. This particular one was a transistor oscillator that received the same voltage which appeared across the movement of the meter that showed either grid drive or final PA plate current depending upon how one set the meter function switch. The device was actually a VCO or voltage controlled oscillator which would give a higher frequency tone as the meter went higher. There was also a pot whose knob had a pointer on it that pointed to a scale of raised dots that corresponded to similar reference points on the meter. The game was to flip a slide switch on the tuning aid to one position in which the meter controlled the tone and then slide the switch to the other position in which the knob controlled the pitch. When the knob's pitch equaled the meter's pitch, then one could read the pointer and, indirectly, the meter.

I have seen at least one other copy of this same tuning aid across the meter of a Heath Kit Warier linear so I am pretty sure the design came out of a "QST" or "73" article of the late fifties or early sixties.

There have also been many, many updates to this design as technology improved and different people solved the same problem so a visit to the local library and a look at an index of "QST" or any other ham radio magazine that has construction articles should yield several tuning devices over the last 40 or so years. Remember that even old designs may have valid ideas in them so while one might not want to totally duplicate that 1964 or 65-vintage tuning device, the principle on which it is based is just as good today as it ever was.

Of course, if the modification is being made to a modern transceiver with a digital display, then all bets are off. One will have to use what is there such as maybe building a tuning aid that uses field strength or connects like a SWR meter and not directly to the rig's own display. Also, remember to keep safety topmost in one's mind. A meter movement in a transmitter may only have half a volt or so across it, but that potential may be totally different when measured between the meter or anything connected to it and ground. One might find 2,499.5 volts between one side of a meter and ground and 2,500 volts on the other side. I'd sure want to be on the low side of that, right?:-) The point is to know what you are doing and be familiar enough with the circuit to make sure there are no booby traps involved in the modification.

Another possible resource for information could be Handyhams
of Golden Valley Minnesota. They are an organization which helps hams
who are blind with study materials and in solving the technical
problems with getting on the air.

Hello!

I have been out of cirulation for some time now, and want to get back into this hobby. I have a real itch to design and build some of my own equipment. Can anyone make some recommendations on an inexpensive CAD program that I can use to layout schematics? The programs that I am familer with from when I was working as a tech are in the $100's or $1,000's and that is a bit too high for a hobby interest :-)

I did run across Design Works Light at http://www.dwlite.com/?0 and my initial impression is good. The only thing that frustrates me some is the size of the component library. I guess I am somewhat spoiled having used professional CAD software :-)

Thanks!
-Al

To all,

The 1999 AWA Auction Results are posted with photos on the following web page:

http://www.eht.com/oldradio/awa/

Note: Why not have your Radio Club link directly to this web page. It's always fresh and loaded with radio history and important radio collecting information. Call it "Page 2" -- and please let me know if you do, thanks. There are about 5 or 6 linking here already, that I know about.

Also on this page: Radio History articles, Old Radio Shows, Big Band Music, an Events calendar, radio museum tours and links - and more all the time.

Source record: 67083

Hi Folks!

I am interested in re-educating myself in the ways of radio electronics. I got my Advanced class license about 20 years ago, and my education since has not been in RF. While I did work as a technician in the 80's, and have a degree in Electrical Engineering \ Computer Science, at no point in my education could I find a class in Communications, Radio, or anything related to my hobby interests. My course work was dedicated to teaching me why a transistor worked, how to design VLSI Chips, and the theory of the physics of electronics. Now I have been working as a Systems Analyst for the last 5 years, and find my memory fading somewhat :-(

So, I am looking for a few things.

1) Suggestions for Web Sites that have some project plans and ideas. Not just radio related.
2) Web Sites, or good books on radio electronics.
3) Are there still any magazines out there on electronics? I don't see Popular Electronics or anything similar on news stands any more.

I remember in Tech School, we had a course on T.V. electronics. In that class, we had a schematic of a color T.V. and the book went through the circuit from beginning to end, explaining each section in detail. I would love to find something like this to go over receiver and transmitter design. It has been a while since I looked at any of the ARRL books. I have memories of them being rather difficult to understand. Years ago I remember reading the handbook and wondering what background knowledge was assumed for many of the chapters. There either seemed to be too much detail, or not enough. But that was a long time ago.

Thanks in advance!

post to "comp.arch.embedded" for the answer.

Personally, I use the PIC Start Plus - cause they give it to you at the Microchip seminar, along with all their books, a CDRom, power supply and a 16C84. It has a very useful ZIF socket and can program all the midrange devices.

I believe DigiKey sells a number of switched capacitor chips. The
general purpose one I like to use is the MF10. Using this one, you
can put together a number of different filter types, not just a notch.
Try looking in their latest catalog.

I want to use a Kite and line as an antenna for a 2 meter handheld.

No hardplan at this point in time. Kite with kitestring/looking for about a 1,000 ft altitude. Probably end up having to have about 2,000 ft of line out to get the altitude.

Along with the line to the kite, plan to have about 26 guage bright wire (from craft shop) to use as antenna connected to handheld. Plan on flying when clear blue sky, but still concerned about static electricity buildup.

Can anyone suggest reference material for learning how to overcome static electricity in this situation. I just recently passed my technicians test and am waiting on call sign, so I have quite a bit to learn.

Thanks,
Jim

You might also check out the freeware version of Eagle from CadSoft at

http://www.cadsoftusa.com/

This is integrated schematic capture and PCB layout with autorouter.
The
freeware version is limited to 2 layers and 1 schematic sheet (no
hierarchical
structures) and the board size is limited, but otherwise it's supposed
to do
everything that the "professional" version does.

I own the professional version and for the money it's the best I've
found.

Eagle is also now available under Linux as well as Win9x and NT.

I have no connection to this company other than as a customer.

Dear Dr. d,

The Philips components homepage is
http://www-us3.semiconductors.com/pip/ and you must type NE612 or SA612
on the search 'exact product name' window; you will get the info on it.
Data sheets are available for SA612 in .pdf format (you have to have
Acrobat Reader from Adobe to read these files; it is free).

Good luck,

Luiz - PY1LL

You could use a 1-1 transformer at the bottom, keeping the antenna line
grounded at all times, and coupling only the signal into the radio.

A few turns around a toroid, and a couple of BNC connectors should do it.

Are you going to run longwire, or small (lossy/expensive) coax to a dipole
or some such?

I don't follow......
All of the filtering and phase shifting is done in the DSP.
The only analog component is a simple low pass filter ahead of the
STEREO (2 ch simultainous sampling etc...) 96kHz A/D.

The low pass filter has to:
-> attenuate 48Khz
-> pass 3Khz
-> provide a constant load impedance to the mixers.

It does not have to be linear in phase,
and many minor imperfections can calibrated out and fixed in the DSP.

Also, keeping thinking about the Weaver method as a demod technique that is more tolerant of hardware deficiencies. Minor cancellation imperfections do not result in loss of image rejection, they merely cause audio distortion. With 25-30 dB of cancellation, this should be inaudible. The image rejection will be as good as the shape factor of the audio low pass filters.

2756. FT8000 Template

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-12 00:00:00 UTC
From: Esp1 <esp1@null.net>
Message-ID: <7QVC3.1083$TZ3.107740@juliett.dax.net>
Source record: 67006

Hi :-)
I am the lucky owner of an FT8000 and the ADMS-2d software... but i am not able to make the template-file. The computer downloads the radio unto 100% is reach... but then i get the message: "Receive timeout". I have tried allmost evrything.. but my settings are correct and my cable is also ok.

If someone has a xxx.tpl file for the FT8000r to mail me i'll be glad :-)
That way i can test if its possible to upload anything to the radio....

Best regards
Espen@Esp1.no

2757. Trade nice air variable for smaller one

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-12 00:00:00 UTC
From: Doug Snowden <ssnowden@primeline.com>
Message-ID: <37DC5DF5.E70B23D5@primeline.com>
Source record: 67007

I have a couple of nice transmitting air vairiables
that are physically too big for an amplifier I am building.
I Need a smaller 1000pf at about 1kv air variable in trade.
I have (trade either of them)

1 Johnson air variable, dual section, each section 11 plates spaced
.25 inch. Part number/value is not readable. Estimate about 150pf total.

1 Cardwell air variable, 1000pf with .1 inch spacing. 47 plates, single
section. This is a brute, but is too big physically. The value is
perfect. Heavy construction.

Huh? Hit send too soon? If you are asking about FM signal
strength, monitor the discriminator voltage. RF (input)
attenuators will likely be needed to avoid saturation.

I have been trying to get a handle on this for a couple of years now
and it seems that the only "turnkey" solution is to buy a Kachina
transceiver with its remote option. You can also apparently buy the
TRZ control software (which works for various rigs) but you need
one phone line for the data link and another for the audio path.
AEA used to make a "hamlink" remote control system that is probably
what you and I really want. I just missed out on buying a used one
for $175.

If anyone is aware of any better solutions, please post them.

>phasing technique.

If you use an I/Q downconverter and upconverter with a digital audio
system, in the non-Weaver case you are depending on the goodness of the analog
circuitry for opposite sideband rejection (receive and transmit) and
for transmit carrier suppression. In the Weaver case, you are
depending on the goodness of the analog circuitry for whistle suppression.
If you do the Weaver technique digitally, then the analog IF is no
longer centered at zero frequency and you are back to the first case above.

BTW, is your patented architecture in production anywhere? What
specs does the product have? It would be interesting to compare
it to the performance of Tom Hornak's IC implementation.

One thing, an external audio filter will not help with strong QRM in the I.F. passband of the receiver, controlling the AGC,and preventing good copy of weak signals. The selectivity needs to be before the product detector and AGC detector, not after. Sort of like letting the horse out of the barn before closing the door. When a receiver is direct-conversion to baseband, then all the filtering can be done in DSP at baseband. This is an advantage of direct-conversion receivers that is just starting to be exploited by homebrewers.

From: Paperboy <btslfke@poboxes.com>
Message-ID: <7rjfv1lav1@zook.lafn.org>
Source record: 67017

I'm interested in reducing the heating power of an electric
frying pan by one-fourth. Went to the local Radio Shack hoping
to find a Variac for the experiment but they've never heard of them.
They do have 100vac to 25vac transformers but that's too low for
my experiment. Then I saw the kit they sell travelers for adapting
appliances to different plug designs and reducing 220vac to 110vac.
I assumed that that device had a 2 to 1 transformer inside and would
be just what I was looking for. No such luck. When plugged into 110vac
it put out close to zilch. Looked inside and saw not a transformer
but what looked like an SCR, three resistors, one cap, and what
looked like a diode. One of the resistors was a 100k variable.
It made little difference to the zilch output when plugged into 110vac.

My question: Does anyone know if this circuit is modifiable to do
what I want, ie., reduce 110vac to 55vac - or therebouts?

I am a professional software engineer and a long time short wave
listener.

I have developed a Windows program that allows you to filter audio in
real time.

Connect the "Line Out" on your short wave radio to the "Line In" on your
PC's sound card.

The program takes the signal, digitally enhances it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a Shareware copy you can try for 30 days visit
my web site:

http://www.winternet.com/~swezeyt/dsp.htm

Gary OM,

The TS520 is an excellent rig. It is not an "ecomony version of the
TS820". It is merely a previous model. They will run for many years
with no problems. My TS820 has thousands of hours of CW and FSK
operation (the 820 has built in FSK, the 520 does not). I have used it
continuously in daily use since 1978. I have never had a failure. All
parts are original.
Do not worry yourself about "which parts fail more often" There is no
answer to that from this group probably. All the basic electrical
components are standard available items. Since it is mostly discrete
circuitry, you can repair to the component level if necessary.
I highly recommend the Kenwood TS5xx 8xx series of rigs, as excellent,
rugged, reliable, and REPAIRABLE rigs. With the pi-net output, you
eliminate one of the big problems with solid state transceivers, namely
the requirement of a near-50 ohm match in order to develop full output.
Throw in a built-in AC supply and almost no price depreciation (use it
for years, sell it for same or more), and I think it is an excellent
cost-effective solution for starting hams as well as established ops.

73,
Don, W6JL

GW,
One thing I forgot to mention is that the 520 and 820 without the "S" do not have digital display. I have none in my TS820, and have never found a need for it in 22 years of operating. You can read the analog dial to within about 100Hz or so, which I have found to be sufficient for all my needs. My homebrew gear has no dial calibrations whatsoever, and I find that suitable also.

Be careful here. I seem to remember that the data format for the
16C73A was different than that for the 16C84, which the PIC Start Plus
board supports. If my fuzzy memory is correct, the 16C84 uses 14 bit
data for programming, while the 16C73A uses 16 bit data. But, verify
this first, since it's been about a year since I've been involved with
PICs.

You'd need to know the maximum power dissipated by the
heating element in your fryer, which might be around
500-1500W resistive. There are two inexpensive ways to
control it's output:

1. Buy/build a high power light dimmer type circuit, which
chops the AC waveform, producing a variable reduction in the
average current through the fryer.
2. Gut a clothes iron or toaster-oven, and use the
thermostat assembly to "pulse width modulate" your fryer to
keep it at a preset temperature.

A traveler's adapter is typically designed for low power
applications such as shavers, requiring rated line voltage
to properly operate; I doubt you can modify it to work in
your application. It might just be more cost effective to
buy a variable temperature fryer.

Michael

Or you could connect a diode in series so that the heating element only
conducts on one half cycle and therefore halving the power input.

2783. Pye VHF transmitter T30 and UHF receiver R470

Message-ID: <JveD3.4890$Sf.15835@news.rdc1.il.home.com>
Source record: 67031

Version 2.0 of my "Getting Started" application for the Atmel AVR8515 is now online at www.dontronics.com/8515

It has drivers for VFD and LCD displays, RC servos, Stepper motors, Text to Morse code conversion and output, serial I/O, many fun bits. It's basically a cooperative RTOS. You'll need the assembler and simulator from www.atmel.com and a chip.
There are shareware programmers available on the web that will program the chip directly from a PC paralell port with a very simple cable.

If you want to go whole hog, atmel has a new emulator for $200

The "Getting Started" code is, of course, free.

For example, you could make a basic repeater controller in about 15 minutes.

the
> image again.

How so? The stereo codecs sample I/Q baseband from a pair of mizers.
The two channels sample simultaneously. From there, it can all be
done
in the digital domain.

All you need is a bit of anti-aliasing filter before each A/D channel
... and
with the available sample rates and the characteristics of sigma-delta
A/Ds,
the requirement should be minimal ... maybe just a single R-C pole.
```

You can also use the Weaver technique rather than the "conventional"
phasing technique.

Actually, in the Weaver architecture the image occupies exactly the
same band as the desired sideband, centered on the carrier. You do
get a "loss of image rejection" with imperfect cancellation, but it
doesn't
splatter into an adjacent channel, but simply appears as distortion in
your channel, which, as you point out is well below your desired
signal and quite tolerable.

In the Weaver method, the LO is in the center of the audio information channel, so the 'image' is one half of the desired audio spectrum. The output of this mixing process is passed through a lowpass filter, so any signal removed from mid-channel by an amount that exceeds the filter bandwidth is rejected. The filter alone sets the interference rejection from out-of-channel signals. Insufficient cancellation merely results in audible aliasing products (aka 'distortion') that should have been suppressed by the second stage I/Q process. The Weaver method therefor has much better and controllable rejection of what most people consider to be the 'image' in a DC receiver, ie, signals on the other side of the received SSB suppressed carrier.
As to the feared 'whistle', this should be non-existant in a DSP based receiver, because the whistle is produced in the second I/Q mixing process. Since this is done mathematically, the audio frequency LO should be completely suppressed. In transmit mode the final LO, though in the center of the channel, is injected in a mixer which has relatively high level RF output. 40 dB or more of 'carrier suppression' is doable, as most of the commercial radio art demonstrates.

2789. 2nd Try: S-Meter Output : SSB vs FM

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-14 00:00:00 UTC
From: luke@trio.COM.AU
Message-ID: <199909140329.UAA01185@mailbox2.ucsd.edu>
Source record: 66939

Note : This is try No 2. Something went wrong yesterday, and
my message got truncated. I also did not get the digest,
and had to re-subscribe! BTW - Does anyone know how
to read the .Z files that these digests seem to be encoded
in on the FTP site?

Good Afternoon People,

I am currently facing an interesting problem with
out current fox-hunting setup (t-hunting, radio sport, whatever).
Our team uses a fairly elaborate automated system called
Rotor Hunter. You can get a brief of this system at
http://www.qsl.net/~vk3zpf/vk3zpfp1.htm

This system uses a laptop and ADC to sample RSSI
voltage and postion and plot the result in polar format.
One of the weak links in out system was the FM receiver,
which had a poor front end, a wide IF bandwidth, and
low sensitivity.

I built a high performance down-converter, which uses
a double-balanced mixer, helical tuned front end, and
low noise overtone crystal oscillator (Many thanks to
Larry for help with the oscillator). The down-converter
IF is 23MHz-25MHz.

We use an ICOM 738 (I think) as the HF receiver. The
S-meter output is picked off (before any dampening),
and is amplified by a DC amplifier. This voltage is then
sampled by the ADC. The problem is the lack of
S-meter output on SSB. On FM it is quite useable,
but SSB is hopeless! You need heaps of signal to
get a small S-meter movement.

You can certainly hear the signal a lot earlier with
SSB, but you can see S-meter movement first
on FM. What would happen if I used the SSB filter,
and hooked up a log detector on the SSB filter output,
like the AD8307 from Analog Devices. The ADC could
then sample the log detector output.

What we really need is better
sensitivity and selectivty than FM can offer, but
similar S-meter output.

Keep in mind, that in Australia, mobile foxhunts
are often weak unmodulated carriers, sometimes

pulsed so you can tell them apart from unwanted
birdies.

All comments or questions are welcome.
Regards,
Luke

The fryer already has that capability with a temperature
sensing bimetallic-controlled sw.

Thanks for the dimmer idea. And also thanks for John Cunningham's
diode idea..
Maybe I'd better explain myself a bit more.
What I want to do is to operate my pan portably with a cheap
300 watt inverter. The pan is 1000 watts. I plan to insulate
the pan and use it as a saturated air or steam cooker.
The French call this type of thing a "bain marie."
How would the dimmer vs the diode approaches work with this
additional info? Don't want to overload the dimmer.

How would the inverter like being connected to the diode-limited load?
Seems like it would overload the inverter if only on the positive swings.

Another advantage for the Weaver method : as the ADC input
bandwidth is half the one required for "conventional" DC receiver,
the computing power is divided by 2.

You could try to rectify the audio output and use it to give a signal
for the ssb mode. You might need to put some delay circuit in to take
care of the pulsing signals. Also see if there is a way to disable the
AGC of the receiver. This will probably kill the s-meter of the
receiver, but you won't be using it anyway.

2797. EM Software, FREE GRATIS YES FREE!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-14 00:00:00 UTC
From: spam@nospam.com
Message-ID: <37de2ec2.17852565@news.lin.foa.se>
Source record: 66947

Whilst nothing is free nowadays, this offer seems to good to be true.
If you go to http://www.sonnetusa.com you can download the Sonnet Lite
EM-simulator for FREE!! If you decide to register the s/w (still free
no money!!!) the capabilities of the program will be even greater.

The complete package icluding tutorials and manuals in PDF is less
than 14 Megs.

This would be a killer add-on to ARRL RF designer!
BTW I just downloade my copy. Looks great! I still have to find out
what the catches are......
Have fun!!

Cheers

The discriminator voltage shows how far off frequency a signal is. It
will normally show zero volts and will not change with a weaker or
stronger signal. Many times the limiter signal is the one to use for
simple meters.

Newark.

The SMD version is actually easier to work with...

I got some from Newark Electronics.

There are some interesting schematics on the web using this chip -
spectrum analyser etc.

The average current would be less, but the peak current would be the same as if run on full power, when using the diode method, or a dimmer on half power.

You're talking about a lot of power for portable operation, I have to think there's a simpler approach.

1) use a lower wattage cooker. A $20 crock pot from wallmart, or something.

2) use a propane or charcoal cooker. cheaper than running an auto engine just to cook something.

3) cook on the auto manifold! Remember, if a car engine is 30% efficient as an engine, it's 70% efficient as a space heater! (only half kidding here)

4) if you have to use this pan, build your own inverter from a set of plans that uses 12v to 110v transformers, but use transformers with a center tapped 110v winding, use a half wave rectifier to get about 50V.

5) Use a 12v cooker. Try either a discount store, or jc whittney catalog.

6) Build your own heater. It's a lot easier to build a heater than an inverter or regulator. Some people build them by accident when they're trying to build something else.

Just random thoughts

For a "Variac" (Variable Auto Transformer) check Fair Radio Sales. There current catalog they have them in stock. They are also on the web.

A second route are "buck and boost" transformers. These are made for the commercial market and sold through commercial electrical supply houses. I know G.E. made theses and was sold through their General Electrical Supply Company (GESCO). I sure Westinghouse and other manufactures also sell them as well as distributor such as Tri-State (DC area) and Gray-Bar electric supplies houses list theses. These were available in split primary 120/240, split secondary (12/24 or 24/48 and some others) in various wattage's for 125W to 2KW and could be run as low voltage transformers or wired as auto transformers the lower (buck) or raise (boost) voltage.

Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday ...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 19th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Walt OM,

Why don't you get manuals for the SB-10 and Viking II from one of the manual suppliers? HI-Manuals is one possible source. The SB-10 manual shows the connections to a DX-100, and you can infer from that how to connect up to a Viking II. It requires modification of the final amp circuit to run AB1 (linear) instead of class C, which requires the addition of voltage regulation (VR) tubes for the screens. The modifications are not that difficult.

Does anyone out there have a design for a 50Mhz / 144 Mhz / 430Mhz
triplexer. I need two to split the signal from a tri band hand held down,and
re combine it after amplification, to feed into a tri band antenna.

Any ideas, or can will someone disect a commercial unit to crib a drawing
for me?

Cheers de Ian, G7DWY

Surface-mount parts aren't necessarily impossible to work with, if you use an iron with a small, clean tip. See http://www.qsl.net/ke5fx/uwave/demod2.jpg for example. I've used the same basic technique on packages with up to 68 pins, and haven't damaged anything yet (knock on wood).

That doesn't mean I wouldn't _prefer_ working with DIP packages, but the unfortunate truth is that most of the interesting new parts just aren't getting released in DIPs anymore.

Hi

I work some hundreds CW QSO's in a year using the rig (FT-902) with
500Hz filter (or is it 600Hz ?) , particularly in contests on 80/40
and VHF/UHF, it is wide enough for tuning around on cw band segments.
Also have DSP-9 attached to the receiver, it is a great improvement -
even set to 500Hz BW, and sometimes I use narrower BW, just few times
100Hz BW, but it is difficult to tune - particularly with the old
YAESU rig.

Assuming that you don't make any attempt to calibrate/correct
for any amplitude/phase imbalances in the digital domain, but
why would one waste the opportunity to do so?

> In the Weaver case, you are
> depending on the goodness of the analog circuitry for whistle
suppression.

No, not if the summing is done in the digital domain before a single
DAC.

> If you do the Weaver technique digitally, then the analog IF is no
> longer centered at zero frequency and you are back to the first case
above.

Huh??? The above statement makes no sense. (it's incorrect, too)

> BTW, is your patented architecture in production anywhere?

At the risk of being blunt, my business dealings are none of your
business.
I merely mentioned the patent because I thought it would be
interesting
reading from some who've been discussing the subject of digital DC
receivers.

> What
> specs does the product have? It would be interesting to compare

Can you provide a reference to this technique? Mr. Hornak's
work doesn't immediately ring a bell, though it's possible that I've
heard of it in the past and just don't recall.

Hi all,

I need to add subaudible tone to some of my aging rigs. I also have some resonator/crystals and ICs used in an some old General Electric VHF/UHF products. Trouble is, I have lost the circuit! The parts have GE numbers on them. The resonator is a Statek, GE# 19A134279-136.5 (I know it is a 136.5 Hz unit - what I need). The associated oscillator IC number is: ICC 7-257 6009 P1 618A (one is probably date code, but unsure which).

Anyone able to send me a scanned image of the circuit from the service manual?

Thanks Much, Woody

Yes, that is done in some HP instruments I know of. The problem
is that any change of temperature vs time makes the calibration
a moving target, thus there are limits to how well you can
successfully correct for these imbalances.

>

If you only have a single DAC, then you need a conventional analog
IF to upconverter, with the image rejection problems.

You mentioned the patent in the context of very superlative claims.
Whenever that kind of statement is made, it is natural to ask

That's a good reason for using the Weaver architecture then, isn't
it? :-)

Why? There are 14 bit DACs that run at >100MSPS ... thats'
more than enough dynamic range for a transmitter.

I don't think the whistle is an issue with a DSP implementation of the Weaver receiver. The first (RF) LO is placed midway in the audio channel (1200 hz away from the suppressed carrier in the SSB case), which 'folds' the 2.4 khz audio channel onto itself so it only occupies 1/2 the original bandwidth. This allows the output to be processed in a narrow (1.2 khz) lowpass filter which establishes overall selectivity (forget for now where's the best place for this filter).The mid-band LO comes out of this mixing process as a DC component. This can be eliminated with AC coupling. No whistle so far.
The I and Q outputs then go to the second stage I/Q demod which is done in DSP. In this demod (or re-mod, more accurately, since it restores the original audio spectrum), the folded spectrum is quadrature mixed with a mid-band (ie, 1200 hz) LO. Since this mixing process is mathematically perfect, the 1200 hz LO should be completely suppressed. No whistle.
The transmit case is more problematic, and Weaver method might not be the right choice. For transmit, the DSP might 'switch gears' and process the signal in the typical phasing method of SSB generation. Image rejection might not be as good as in the Weaver receiver, but it doesn't have to be as good. For a receiver, I want the image product to be better than 60 dB down. For transmit, I might be happy with opposite sideband suppression of 45dB.

2822. Merit plate transformer specs?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-15 00:00:00 UTC
From: Lynn Coffelt <lynnc@sos.net>
Message-ID: <37E03EB4.53775C54@sos.net>
Source record: 66887

anybody with time to look in their files for an old "Merit Coil and Transformer" catalog to help me with the specs for a Merit P4062 plate transformer? My once complete stack of catalogs has been eroded by time. I acquired this transformer years ago for a planned linear amplifier. I think the plan was for 115vac in and enough out for a pair of 813's grounded grid. Well, the data plate's total technical data is "300ma". Fine! A little more would be helpful!
Anybody with time and resources to help?
Thanks in advance, Lynn, W7LTQ

I have no experience with >either of these filters.

Hello Ray,

The best answer is to install both filters, if possible. Some rigs (like the better Ten Tecs) let you do that, while others allow only one narrow filter. I had a Ten Tec Argosy with the 250 Hz filter for a few years back in the early '80s, and it was great.

The 500 Hz filter is good for all around use, but when the going gets tough, a 250 Hz filter can make the difference.

Some narrow filters do "ring", but that is a result of inadequate design for the application. The above mentioned 250 Hz Ten Tec filter did not ring.

Some folks don't like to use narrow filters because "tuning is critical". This is actually an indication that the tuning mechanism of the rig is inadequate for the job. Most analog VFOs on commercial gear give 18 to 25 kHz per turn or more, which is way too fast. They were designed that way because a really good reduction drive costs money, and also because many hams don't like to have to crank the knob a couple of dozen times to get from one end of the band to the other. Newer rigs, with synthesized VFOs, are usually much slower - less than 10 kHz per turn - because they use optical encoders, and an encoder with fewer slots is cheaper. Plus you can make big frequency jumps with the keypad.

Audio filters can have impressive specs, but they are of limited use because they are so far from the antenna.

AGC is of limited usefulness in CW reception because it responds to the sum total of all the signals in the passband. In most QRM situations, turning off the AGC, reducing the RF gain and raising the AF gain to compensate will make a world of difference. Sadly, most "modern" rigs don't allow you to turn off the AGC. Best bet with them is to use as much AF gain and as little RF gain as possible. The fact that the S meter doesn't work under those conditions is of no consequence.

What do I use? Glad you asked.

The main HF rig here is a homebrew three-band CW transceiver. Receiver filters are a pair of milspec 8 pole 500 Hz units, cascaded. I found the filters at a

hamfest about a decade ago - each one has a shape factor of better than 4:1, combined shape factor is 2.5:1. No AGC. No S-meter. No ringing. Main dial uses the integral gear-reduction/tuning cap from a WW2 frequency meter - absolutely no backlash, and does 5 kHz per turn of the big 2-3/4" skirted knob. There is a passive LC audio filter at the output too. I wish the filters were a little narrower, but they were the only ones available. The rig was literally built around them.

Good luck and hope you find a 500 Hz filter so you have both!

> frying pan by one-fourth. ....

Reading the various posts I think what you are saying is "reduce the heating power 'TO' one fourth". ie one quarter of the power by halving the voltage. Right??????? (v x v)/r = w

Presuming your inverter is powered with, say, 12 volts and your electric fry pan is 1200 to 1500 watts when operated 'normally' on 115 volts AC and if you are successful your will need about 300 watts at 'half voltage'.

300 watts at 12 volts is roughly 25 amps. Quite a load! You may get one hour out of a normal car battery if well charged?

I think the safest method would be to use a 2:1 transformer. 110 in 55 out. A conventional primary/secondary transformer would need to handle the whole 300 watts. However it is possible to connect in a voltage 'bucking' arrangement so that the transformer only carries half the wattage. Also a centre tapped auto transformer might do it. In all cases the transformer windings would need to carry the approximate 6 amps of current required; 6amps X 55volts = 330 watts (ie. one quarter the 'original' power).

I frequently use a 500 watt transformer to power a 230 volt electric drill from 115 volts (ie. to step UP the voltage). What you want to do is to step DOWN the voltage.

The diode idea may still result in 'full' current flowing on the conducting half cycle of the diode, which may be bad for the inverter? And would result in 'half power' (say 600 t0 700 watts) not a quarter. I think that right.

Just some thoughts. Terry S.

2827. Re: Reducing 110vac to 55vac

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-15 00:00:00 UTC
From: Paperboy <btslfke@poboxes.com>
Message-ID: <7rn9vb$d7d$1@zook.lafn.org>
Source record: 66973

Some very interesting thinking shown on this thread. Thanks for it.
I thought I wouldn't have to say much on "my experiment" but I can see
now I was mistaken, as it is an end-to-end kind of thing.

I have found that I can operate a small 1000w electric frying pan
set to about 190 degrees at an average power consumption of approx 5 watts.
To do this I insulated the pan as best I could and monitored it closely.
In the end I hoped to be able to operate the thing from a 12v battery.

Large wattage fry pans maintain their temperature with a dandy little
bimetalic-strip-operated off-on switch. They are not like crock pots which
(on the low setting) just balance off the input power of a constantly *on*
coil with the heat dissipation characteristic of the entire appliance
at household temp. A crock pot's only *regulation* is that it always
has some water in the mixture and that keeps the innards from going
above the local boiling point of water. Insulating a crock pot will
only help it get up to speed more quickly. Once that occurs the insulation
only increases the hazard of the operation.

Well I couldn't do anything about the resistance of the built-in heating
coil but I *could* reduce the incoming voltage.
I figured that if I could reduce the input voltage by about half,
I would reduce the pan's power by about one-fourth or to 250 watts.
(hope I did this right!) 250 watts was just right because it not
only gave the extra oomph the pan needed to get up to temperature
in a reasonable length of time but it also made a cheap 300W inverter
possible.

As to the suggestion that I use a husky diode in the line, that sounds
like the way to go - even elegant! But I wonder how the inverter
feeding this diode-pan combo will feel about it. Won't it be overloaded
on the up swings and not loaded at all on the downswings?
Will it be able to average this out without getting fried itself?

Maybe the thing to do at this point is to just try it.

2828. Re: Reducing 110vac to 55vac

>Will it be able to average this out without getting fried itself?

How the inverter reacts depends on the inverter itself.

Some inverters (you can recognize them because they're relatively
large and heavy for their power rating) operate by feeding 12 V
alternately between the two halves of the primary of a transformer
at 60 Hz. (For example, the primary center tap goes to +12, and
the two ends of the primary go to the collectors of transistors
with their emitters at ground. By energizing the two transistors
alternately, you produce 60 Hz square wave AC in the transformer.
The secondary provides 120 V.

This sort of inverter might well be unhappy with a diode in its output,
because there is then a large DC component to the transformer current -
it might saturate.

Another style of inverter (smaller and lighter for their power
output) run the inverter circuitry at ultrasonic frequencies,
perhaps 50 kHz. There's a step-up transformer used here, but it
can be much smaller because of the higher frequency. The AC out
of the transformer is rectified to about 170 V DC. Then a set of
4 transistors called an "H bridge" turns the DC into AC by connecting
the two AC output wires to the 170 V supply in alternating sequence.
(i.e. "hot" is connected to +170 V while "neutral" is connected to
0 V for 8.3 ms, then "hot" is connected to 0 V while "neutral" is
connected to 170 V for the next 8.3 ms).

If you connected a load with a diode in series to this inverter,
it would likely not be disturbed. The transformer is still operating
with symmetric AC no matter how asymmetric the output load is. One
half of the H-bridge is essentially doing nothing, but as long as
the total power you're drawing is less than half the rating of the
inverter, the other half of the H-bridge is fine. Note that if
you try to draw *more* than half the inverter rating, you might
overstress the H-bridge transistors, since they are designed to
provide at most half the rated load power.

Got some more of these frequency references, unused precision SC
cut oven controlled crystal oscillators at 16.384 MHz that can be
divided down to
1,2,4kHz etc., they approach small rubidium in long term stability and
do better in short term stability.
This is the only frequency I have, as Im an oscillator designer I
recognised these (parts in ten to the eleven/day) oscillators when they
came on the market from a cancelled cellular phone system in the UK,
Now 10% list price ie UK pounds ï¿½50 or $equivilent + postage many units
shipped to US etc.
Email for more details and circuit to lock any other crystal around
10MHZ in 1kHz steps.

[This is a one-time announcement.]

The Triode Board is a new solution to the control and protection of triode power amplifiers. It follows the same successful formula as G3SEK's Tetrode Boards: all the necessary control, protection and metering circuits on a ready-made PC board, along with a comprehensive User Manual and on-line support.

The Triode Board is configurable to use with almost any amateur-size grounded-grid amplifier, and has been tested on a wide range of triodes. More details on the web site!

The kit includes a double-sided PC board with printed component locations, all the components for the PC board and the 38-page User Manual. Experienced constructors can buy the bare board and the User Manual, which includes a complete parts list.

For details of the Triode Board and Tetrode Boards, visit
http://www.ifwtech.demon.co.uk/g3sek

Triode Boards are available NOW from G3SEK.

In the USA, Triode Boards and kits will be available in mid-October from Down East Microwave, Inc at (908) 996-3584.

I have both Design Works Lite and the Eagle freeware version.
If you only want to draw a schematic DWL is quick and intuitive the
components you need are almost all available from the generic list.
Creating special components is fairly easy.
Just started using Eagle and so far looks very good.

I know what you mean, we've been soldering SMD stuff by hand here for 10 years, we just recently got $80,000 worth of pick and place but we still prototype by hand.We had to use a 144 pin SMD flat pack VGA controller in a recent project and we use Press-n-Peel to make a small adapter board so we could wire wrap to it. It was tough getting that small of lines using P-n-P but it worked just fine untill I blew the chip and had to replace the whole thing when all the pads came up when I tried to remove the chip. When it comes to prototyping and one-of-a-kind boards, give me sockets, but if not I wish the surf board people would make adaptors for large chips.

2836. Heath Zenith educational materials and Heath Manuals FS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-15 00:00:00 UTC
From: Ken Simpson <W8EK@fdt.net>
Message-ID: <nfRD3.953$fq2.25240@monger.newsread.com>
Source record: 66982

I have several Heathkit Zenith Educational Systems
courses available. They are from the 1978 time frame,
but since they are theory books, should still be
useful. Each book is $ 7. All are in good shape.

I have the following:

DC Electronics - Current and voltage through
Inductance and Capacitance

AC Electronics - AC, transformers, tuned circuits, etc.

Semiconductor Devices - Diodes, Bipolar, FETs,
Opto devices, ICs, Thyristors

Digital Techniques - Book 1 - Logic Circuits, ICs,
Flip Flops, Shift Registers, Logic Circuits

Digital Techniques - Book 2 - Counters,
Shift Registers, and Clocks

I also have some Heath manuals available.
All are ORIGINALS, not copies, and are in
good condition.

Heath HM-2102 VHF Wattmeter $ 8

Heath IM-28 VTVM $ 7

IO-103 Five inch scope $ 10

GR-2000 TV Set $ 10
GR-2050 TV Set - Five book set $ 18
GRA-2000-1 TV Clock $ 3
GRA-601 TV Clock $ 5

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

Ken Simpson

T30FM is a quite good NBFM tx provided you do some 8-10 hrs
modifications on it, some old versions are hard to drive to full
power, but with mods it is easy to get 25-30W on 145MHz
believe it is T30MN and T30AM versions, too. I've worked with several
T30FM at work and at home. The original version may have spurs, I
remember one caused interference on nearby 2182kHz receiver, but all
problems are easily solved

Hello all,
I have just bought a not working GDO,
from a rally, its got the box, meter, coils etc.
but it aint sending out any signal.
Its getting on a bit , so.
I would like to use the bits, to make a new GDO.
Has any one a schematic of a GDO circuit ?
With a board print out, I can develop using UV light box. (last project)
So I can make and reassemble this box of tricks.
Thanks. Bob

Hello,

I've been doing research on the classic CK722 germanium transistor from the 1950's/60's. You can find details at:

http://www.geocities.com/~ck722transistor/

i'm always looking for CK722's to add to the collection. Also, if you have any homebrew projects that were built with the CK722, I'd like to know about it.

Thanks

Jack:

My gosh...

Yes, my radio and electronics construction experience began with the CK722 when I first built (in 1960) the One Stage Audio Amplifier then later with, Combination Crystal Diode And Transistor Radio Receiver that was described in The Boy's First Book of Radio Electonics by Alfred P. Morgan. The transistors were bought across town at the Lafayette radio store on 111 Jericho Turnpike, Long Island, New York.

The mere mention of the book series by Morgan ought to spark untold memories from the past; and now the CK722 whoa... a double whammer for sure. Check that series for more circuits using that transistor; there were five books in all. Get the older editions; the new ones used different parts.

BTW, anyone know what the original tube (octal) was that Morgan used in the one tube amplifier in the old 'First Book' (it wasn't a 6BF6).

GDO is a pretty simple oscillator. When the frequency of the oscillator matches the frequency of the test circuit an absorbance of energy ocurs causing a decrease in grid current.

Is the B+ working? Is the tube OK?

Cross-posted to: alt.ham-radio.vhf-uhf;,rec.radio.amateur.homebrew

I have a pair of old Kenwood VHF rigs: TS-600 & TS-700. Currently, both radios function in one mHz "bands" for 6 and 2 mx. I am looking for mods that will allow a 1mHz RX-TX split for repeater operation on the TS-600 for 6mx FM use. Currently it is simplex only use. On the TS-700, Kenwood has designed repeater offsets into the radio. However, 144,145,146 can only be negative offsets and 147 can only be a positive offset. We have a local repeater with 146.46 input and 147.06 output. I'm looking for a method of allowing this different offset. What I need here is different from "repeater reverse" which the TS-700SP already has. Any help or ideas will be greatly appreciated.

> small value will be needed
> John Cunningham
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
John: Yes I've done this. Note 1.

For example at 60 cycle (yes I know it's hertz now) a one microfarad capacitor has a reactance (Xc) of approximately 3000 ohms.(Roughly, after all some capacitors are made to to plus/minus 20%!). One microfarad is 10 to the-minus 6 Farads.

Without bothering to draw a vector diagram (which is the proper way) one can, roughly, say "lets see I want pass 6 amps". (You can also note that the R ohms of the frying pan or whatever he is using is fairly low. For example at 1200 watts, thats roughly 10 amps at 110 volts; so, V/A = R is 110/10 = 11 ohms.).

Voltage is 110 (well lets make it 120 it's easier!) So, 120/6 = 20 ohms. so I will need 3000/20 = about a 150 microfarads non polarized (AC) capacitor that can withstand peak voltages of around 160 volts, continously.

All very rough and ready. But works!

Note 1. At one time I operated the filament/heater of a tube which required I recall 0.3 amps in series with a capacitor and the 230 volt 50 cycle mains. Lets see if I can recall the calculation. 230/0.3 = 700 ohms (Xc).
Since one microfarad is 'approx' 3600 at 50 hertz; a 5 microfarad capacitor was used.
I recall using scrap, paper wound telephone equipment capacitors (condensors), which, while only 'rated' for 48 to 52 volts were routinely tested to 2000 volts. They came in 1, 2, 4 and 0.5 and 0.2 microfarad sizes so you could paralell for different values.

Note 2. BTW; on the subject of capacitors/condensors and AC; Many years ago (like 30 maybe), someone gave us a high quality equipment fan saying that the only way it would start was if you spun it by hand and even then when it was running it had no power! We still use it to this day, fastened to a piece of plywood, to exhaust attic heat in summer, dust from workshop or as portable powerful high output fan. The trick was to use one of the capacitors mentioned above to provide a pahase shift to the secondary fan motor winding with 'full' 110 v AC to the 'main'

winding. Only replaced the 48 volt rated capacitor (0.5 microfarad I think) once; in about 30 years. It works so well that I have never bothered to experiment with different capacitor values! Just plug it in and off it goes like a dust storm; motor not hot either.

All the best. Sorry to be so long winded!

Terry S.

2847. DDS Chip

Hi Everyone,

I need a DDS chip, and would rather NOT use the Analog Devices chips (if possible). I need a SIMPLE DDS chip, don't need amplitude control, PSK generating/phase shift capability and 1 hz steps up to 500 kc output frequency would be great.

Parallel or simple serial inputs to control the output frequency would be a plus.

Does anyone make DDS chips or am I stuck with the AD super chip?

Thanks,

Art

>but SSB is hopeless! You need heaps of signal to
>get a small S-meter movement.

no, S-meter or AGC derived reading on cw/ssb is often useless, why not
install an IC and use RSSI for FM as well as SSB/CW, I have good
experience using MC3356P in my FT-902 on all modes - 70dB range is far
more than needed, but AD8307 is even miuch better. Another problem is
that you don't need large range because then you cannot read small
signal variations, perhaps a provision for 20dB range would help for
fine adjustment of DF-antenna.
>
>You can certainly hear the signal a lot earlier with

>similar S-meter output.
>
it seems to be a minor problem on ssb and cw that MC3356 has no
S-meter hang effect, I would assume the same problem exists for
AD8307, you need to attach a simple sample & hold circuit

Right up there with the 2N107 and the 2N170......

One day in the early 70's I was in one of the larger electronics stores in the Northern Virginia area. A "Grandmother" came in with her "Grandson" about 10 years old. He had a schematic from a Cub Scout Book, and was seeking parts.

The clerk (no older than 20) started with the CK-722, and said he had never seen a number like that before, didn't have any of those, but he would look up the equivalent in his big book. The equivalent turned out to be a 2N##### something and cost about $10.00 or so.

Grandma decided they were in over their head and told the clerk they would have to think about it. She wasn't sure that the little Scout badge was worth that much money. They left.

I followed them out, introduced myself as a Ham and a former Scout and asked if I could see the schematic. It turned out to be a very generic one-transistor receiver. I went back inside with them, purchased a cheap (about a dollar as I recall) generic xstor and gave it to the young man along with my phone number in case they had any problems. He and Grandma spent another few dollars for a couple resistors, a ferrite loopstick, a small variable capacitor, some battery stuff, and a little earphone.

I got a call about two weeks later that he and his Grandma got the radio together and had heard several local stations. They were going to have the neighbor help with a little longer antenna and would take the radio to his next Scout meeting. I got a second call a couple weeks after that when the Scout received his badge - I think it was either his Bear badge, or a Silver Arrow for his Bear Badge.

I think about that kid every year about October when jamboree On The Air (JOTA) time rolls around and all the Hams and Scouts take to the airwaves. Sometimes it all works out right!

The Old Radio Museum will be at the Marshfield Mass. Hamfest Saturday.

To all,

The Old Radio Museum, recently seen in QST magazine, Antique Radio
Classified and the AWA OTB, will be at the GENESIS AMATEUR RADIO SOCIETY
Hamfest in Marshfield Mass. this Saturday, September 18th.

Marshfield is located between Boston and Plymouth Mass., just off of
Rt 3. The meet is at the Marshfield Fair Grounds. It looks like the
weather and the meet will be great! Hope to see you all there.

Hamfest information:
http://www.capecod.net/~tebolus/flea/flea.html

Museum information:
http://www.eht.com/oldradio/museum/

Hope to see you all there.

This topic comes up periodically in rec.radio.amateur.antenna, and there's been a lot of discussion there about it. You might take a look in Deja-News (http://www.deja.com) to see what's been said. It seems that very few people have acutally built one, and of those who have, I don't believe any have been able to come anywhere near getting the claimed results. Only Egyptian broadcasters with questionable measuring equipment seem able to pull it off.

2855. Fm Reciever Help???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-16 00:00:00 UTC
From: Brian Snyder <ussc@technologist.com>
Message-ID: <37E1CB66.3D3A5F17@technologist.com>
Source record: 66905

I am looking for some plans/schematics to build a simple FM reciever. I

have scoured the web and find a ton of stuff on transmittrs and now that

I have built a dozen or so tx's, I want to build a matching reciever
that is tuned to them. I have been using a store bought reciever to
test my little transmitters but would now like to learn how to build a
basic reciever for them.

Can anyone help me out here?

Please email me: ussc@technologist.com

The older Harris NCO chip should do what you want. However, by the time
you've added the DAC etc. you will probably wish you'd used one of the
ADI devices.

2858. Coax adjustable in length, how??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-17 00:00:00 UTC
From: franspin@my-deja.com
Message-ID: <7rt801$1te$1@nnrp1.deja.com>
Source record: 66908

I am looking for constructional details of a coax line which can be
adjusted in length by sliding in/out. It is less destructive in
experiments than cutting cable to the required length.
I have heard about it. Searched the net but can not find any reference,
since I do not know the propper English name for it.

How can help me?

Thanks,

Frans Pinkse, PA2F

2859. Voice-over-IP repeater linking?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-17 00:00:00 UTC
From: dogbert@mindless.com
Message-ID: <37e230c4.471500920@news.earthlink.net>
Source record: 66909

Pardon my ignorance on this topic, but are there repeater controllers
for linking repeaters which can use the public telephone network
(dial-up) instead of RF as the linking mechanism? (And if so, are
there any recommendations on brands or pointers to web sites to any
products like this?)

There is some interest in my ham club to link two repeaters at
opposite ends of the continent using voice-over-IP technology,
both as a technology showcase and also to link people with
similar interests despite the wide geographic separation.

I figure this is "homebrew" because at the very least,
some additional hardware and possibly firmware would
need to be developed by our club to meet custom requirements.

Any pointers or leads are appreciated!

Take a look at http://www.irlp.net/irlp/
This is the Internet Radio Linking Project, something that one of our club members has been working on for a couple of years. There are currently 6 repeaters that can be linked on command (DTMF codes transmitted over the air) to our local VHF repeater. The other repeaters are mostly in BC, Alberta, and Saskatchewan, but there's one in New Brunswick.

>I figure this is "homebrew" because at the very least,

The system runs on a PC running Linux. There is a custom interface board involved, but it's already been designed. You also need a decent fast Internet connection.

Hi to all-

I have an R7 that is a little better than a parts radio
but is missing a couple of majot components.

I am looking for a dead R7. Rusty, water damaged, lighning
damaged (if bandswitch is OK) or ...

I need the complete bandswitch assembly.
The PTO buffer/Audio board
The 5, -5, 10, 35V regulator board.
Some of the little pushbuttons.
A meter.

Please write and let me know what you have.

You needn't worry about embarrasment.
I won't poke public fun at you or your
radio. Private maybe :-)

Thanks Paul,

At present, I am UNAWARE of any 'simple' DDS type chips by AD. I have found and studied the AD 9850, 9851, 9830 and 9832.

All take very major efforts to even program a single output frequency>>:

All go way past my basic needs, which is a SIMPLE local oscillator to run between 285kc and 325kc.

I don't need multiple input registers, amplitude control, or psk/qpsk generating capability.

At this point, a PLL is more practical, atleast for my ap--but I'd really like to use a DDS if possible-it has the capability to generate test signals for receiver alignment and that's a BIG PLUS.

The 32 bit input word combined with 4 other inputs that must be toggled to load data is a problem for me as I cannot program pic's.

Any other info is appreciated.

What you are looking for is called a "transmission line stretcher". I've seen and used them for VHF and UHF freqs.

Those *are* the simple chips.

Have a look at the AD7008, which is just about as brain-damaged
as DDS chips can get. See if you can find one of the old (and
long obsolete) parallel input chips. I use a Qualcomm Q2220
in a DDS VFO and program whatever spot frequency I want by
installing diodes in a little control board...

Sorry, but if you're going to play with the technology you need
the tools, and DDS chips assume that you will use a microcontroller
to program them.

Fortunately, you don't have to be able to program a PIC to control
the AD DDS chip(s), you only have to be able to burn a PIC.

There seems to be a lot of PIC code available for your application
at: http://www.waterw.com/~njqrp/ham-pic/projects.htm

I'd like to see a similar project for VHF and UHF using a DDS
to provide the reference for a PLL, as described in QST by Rhode.
I bought a copy of Easy PIC'n, but I'm still at the very start
of the learning curve.

I've got a bunch of surplus glass-encapsulated capacitors -- the kind that look like diodes, but ... aren't. (a grab bag special).

They seem to mostly have values in the pF range.

Anyone know what tempco they're likely to have? They *seem* very stable when I heat and cool them while hooked to my capacitance meter (reads down to 10pF or so). But then so do silver micas...

thanks and best regards,

Hello all.

I'm not half-bad with digital things, but for some reason, PS stuff is just a little beyond my reach. However, I need a PS that can supply in 10A DC, at a range of voltages (from ~2v to ~30v). So far I've been combing a variety of web sites, to find a schematic or two that can do supply this sort of thing. I've found a couple, main application notes for voltage/current limiters. However, I'm at a loss as to the specs that certain parts within these schematics need. For example, what sort of transformer and rectifier bridge/diodes should I be looking at? Also, where could I find these things? The locals are not much help, other than saying that "oh, you'd need a 10A rated transformer, CT, with a rough 35v output (from 110v input)". However, they don't have transformers such as this, and looking at some catalogs (very old ones), these things are HUGE. Am I deluding myself that 10A over 2v-30v is not "that much"?

Also, if anybody can say where I can get LM395, LM101A, LM308 type of things, that would be mondo cool too. Also, if these devices are not available anymore (for a reasonable price/quantity ratio...), are there suggestions for replacements?

(Oh, linear thingmajig, not switching...)

to
> run between 285kc and 325kc.

Have you considered a PLL, followed by a divider? Build the VCO
to cover 2.850 MHz to 3.250 MHz and divide by 10. I believe that
Motorola may still make some parallel programmed PLL chips, though
most of the newer ones are programmed by a serial bit stream from a
uController.

Actually it is as easy as that, if you use singly terminated
Butterworth filters. Simply parallel the unterminated ports of
the low pass and high pass filters and you're done. The two
filters must be duals of each other. This was written up in
Trans. IEEE on Circuit Theory around 1956.

2879. varactor gamma and linear tuning?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-17 00:00:00 UTC
From: Bert Douglas <bertdNOSPAM@bellsouth.net>
Message-ID: <WZDE3.5785$Lt.42480@news4.mia>
Source record: 66929
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.cad,sci.electronics.design

Hi all,

Can someone please enlighten me a little regarding varactor gamma and linear tuning?

If you have an LC tuned VCO with a varactor, then the frequency is proportional to the reciprocal of the square root of the
capacitance.
F ~ 1/sqrt(C)

So if it is desired to have equal frequency change with equal voltage change on the varactor, then what should be the gamma for a
single varactor? And for back to back varactors?

Thanks,
Bert Douglas

I'm looking for an Alinco DR1200 control board (front panel assembly)

If anyone has a dead DR1200 with a good control board please e-mail
me at kb2zlz@yahoo.com

Thanks.

2882. Why narrow FM instead of AM on VHF?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-18 00:00:00 UTC
From: jhoyos@hoth.gcn.ou.EDU

The modulation index for narrowband FM is much less than Pi / 2.

Mischa Scwartz in his book Information Transmission, Modulation, and Noise, 3rd edition, says: "The noise and interference reduction advantages of FM over AM, mentioned previously, become significant,however, only for large modulation index (greater than Pi / 2)."

So, accepting Schwartz is right, why do they use narrow FM instead AM ?

Thanks in advance.

Jorge Hoyos.

Power consumption and weight, probably. Narrow FM can be modulated with a voltage amplifier and a variable-reactance device. (today, usually a varactor diode - in the late 1940s, a single receiving-style tube) Efficient 100% modulation AM requires an audio power amplifier with power output equal to half the DC input to the final RF amplifier. And, a heavy modulation transformer or choke. Grid modulation can substantially reduce the audio power required, at the expense of lower efficiency of the RF amplifier. (so you may not save much if any DC power overall)

In some amateur stations, RF susceptability of broadcast receivers was also an issue. Some very cheap radios were being sold at the time, (early 1950s) and they were quite susceptable to pickup of VHF RF. (some things never change<grin>) If the VHF transmitter was running AM, the modulation would be fully intelligible and the set owner would know who to complain to/about. If FM was used, the pickup might not be noticed at all - and if it was noticed, it would probably appear to be unmodulated. The set owner might never know what was causing it.

Also, doesn't that statement only apply to random thermal noise? I would think lightning static and many man-made noises would still be less of a problem with narrow FM.

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Feb & April - Dec $1.00 ea.
1994 Jan - Oct & Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea. (May issue is missing page 73)
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45

One contributing factor is that in mobile communication, the signal variations are huge and fast, especially at higher frequencies. On 1.3 GHz, you might have more than 100 signal dropouts each second at highway speed. The problem with AM is that the audio amplitude is proportional to IF amplitude, thus a very effective a.g.c. is needed to keep the IF amplifier output level (AM detector input level) constant.

Now that the RF signal variation is nearly as fast as the lowest frequencies in speech, it would be very hard to keep the a.g.c. voltage and the audio band separated. Using sufficiently fast a.g.c. would also smooth out the lowest audio frequencies.

In the 70's, there was a lot of hype about SSB with a (3-4 kHz) pilot tone for mobile communication, but I have not heard anything since about it. Apparently the fast amplitude variation killed also these systems.

In FM, you can run the signal through the limiter and the audio level is then only proportional to the frequency deviation, not the RF signal level.

It depends on the type of junction in the varactor - normal, abrupt or
hyperabrupt. For abrupt junctions, C is inversely proportional to the
square root of the bias voltage, so the frequency is proportional to the
fourth root of the voltage.

Jack!
Great idea for a web site! When I talk to contemporaries about the CK722, the usual response is a blank stare. One did remember, but was a fan of some others- - - 2N106 (or 107?).
How much did they retail for when first introduced? I wanted one to experiment with, I think maybe 1958 or 1959, and the price was something like $18. More than my hobby allowance!
Several months after first inquiry (was it "Tucson Radio Supply"?) the price came below $10.
That single unit-- usually twisted into the circuit, to avoid soldering heat-- and on higher class experiments "fehnstock" (spell checker can't help here) clipped into the circuit, was a microphone amplifier, a radio, and a code oscillator. Somewhere around June of 1960 it's gain went to zero. (I guess all the "holes" got plugged or something).

Is it?? Pi / 2 = ~ 1.57 to 1 <use radians not degrees>

M.I. for typical 2 meter is much greater than 1.57 to 1. Consider the
following:

Assume a bandwidth of 5 kHz in your 2 meter FM rig.
Assume your repeater uses a tone of 100 Hz for access, finally assume
your tone encoder is set for 10% 'modulation level'.

Your 100 Hz tone at 10% will cause a 500 Hz deviation in the output.
(deviation ratio of 10%)

However the Modulation Index is the bandwidth (5 kHz divided by the
frequency of the modulating signal e.g. 100 Hz, or 50 to 1).

Modulation index is described mathematically by a Bessel function...
complicated math.

I think your error was in assuming that pi / 2 had units of degrees
instead of radians.

Hi all,

Thanks for all the answers on how to compensate for non-linear varactors.

But I need to get real linear voltage to frequency tuning.

I am doing FM on the same varactor. The PLL loop frequency is lower than the modulation frequency. So without linear tuning, I
have the change the gain on the modulation source for each different frequency. Also with widely different VCO constants at
different ends of the band, some compromises are required with the PLL loop filter.

So I am still seeking answers. Thanks for any help.

Q1 - Varactors are available with constant gamma, with specified gamma of 0.5, 1.0, 1.5, 2.5, etc. What gamma do I want? Can a
constant gamma varactor give me linear tuning?

Q2 - What exactly is meant when it says in the data sheet that the gamma of a varactor is 0.5? It seems to me that the gamma is
really minus 0.5? Capacitance always decreases with increasing voltage. Or does gamma mean something different than usual when
related to a varactor?

Q3 - Can I use some kind of compensation network to get linear tuning from an arbitrary varactor? I am thinking of other capacitors
in series and parallel with the varactor.

Lynn, Jack,

I do remember the GE 2N107 and it's npn cpunterpart, the 2N170.
I bought mine in the early 1960's from theLafayette store in Jamaica,
Queens.
The price was very reasonable.

I have a 1966 Lafayette catalog, and I see the price of the transistors
were 55 and 75 cents. They are classified entertainment grade
an are cheaper than a Texas Instruments 2n2222 at $3.97
or a "Minuteman Series" DTL SN337A flip flop at $70.00.

I also built a one transistor crystal radio using fahnestock clips.

Lafayette later moved to Syosset, Long Island.

I still have the transistors in the origional boxes.

By the time I began playing with such things (somewhere around 1957), two transistor types were available, the CK722 and CK721. The former was $1.00 and the latter $3.00. This was in Juneau, Alaska, where prices were considerably higher than "outside". (It wasn't the "lower 48" yet because Alaska was a territory at that time.)

Source record: 66930

I havent (exactly) tried this, but here goes....

Check hobby/craft stores for thin wall hard drawn brass tubing. It is available in sizes from about 1/16" to nearly 1" in diameter, graduated in size to telescope into one another with a tight clearance. They usually come in 1 or 3 foot lengths. I have used this stuff in fabricating connectors for hardline using flex coax type Ns. The inner conductor / outer couductor diameter ratio will determine the impedance. Solder an inner conductor to a chasis connector (like "N"), and the outer (shield) to the connector shell. Keep 'em concentric. This brass is tougher to solder than copper, but with proper cleaning, an active flux and proper heat it works. If needed some spacers could be easily made (washer-like) using teflon, polystyrene, or possibly plexiglas. These may limit travel.

Make 2 of these, somewhat longer than 1/2 the max length required. For one of the two, use tubing of 1 telescoping (smaller) diameter for both inner and outer. Now, on both the inner and outer tubing (of the smaller diameters), make a number short (1/8"?) axial cuts along the diameter. This will disturb the tubing enough to produce a slight interference fit. It will help to make the inner a bit longer than the outer (shield) to facilitate assembly.

Carefully telescope the tubing(s). If the fit is too loose, use needle nose pliers to slightly twist each of the small tabs formed by the cus on the end.

Voila!.... Good Luck, Woody

You are right, Bert.
Varactor tuning is normally linear only for little voltage variation
around certain DC value. Besides that F formula above, the capacitance
value is not linear with V, being a dacaying exponential curve. The
results cannot be linear.
This is sometimes a rather serious problem when designing wideband PLL
synthesizers because it is difficult to preview what will happen when
big frequency shifts are desired.

That sounds very like the range for USCG DGPS signals. Are you sure you
want the LO frequency there, or are those the frequencies you want to
receive? Or both (i.e. direct conversion)?

These are multilayer ceramic capacitors, which can be made from a variety of ceramic materials, differing greatly in temperature characteristics. If they're even reasonably stable, they're probably either C0G (NPO) or X7R, or similar. The latter is "temperature stable", and there are many varieties with more-or-less similar stabilities. X7R has a specified maximum change of +/-15% over the range of -55 to +125C. I'd expect to see several percent change from heating with a soldering iron or cooling with spray cold. NPOs are more stable. They also come in more than one variety, but one of the more common, C0G, has a tempco of no more than +/-30 ppm/degree C. You shouldn't be able to move one of these even one percent with the same heating/cooling regimen.

Another common type of ceramic is "high-K", which is very temperature unstable. One of the most common varieties is Z5U, which can change -56 to +22% over the range +10 to +85C. By your description of your tests, this is not what you have.

Hi guys,
the original CK722 was quoted at $12 originally (end of 1952) but quickly dropped to $7.60 by Mar '53. Continued to fall in price, until it hit .99 cents by end of 1955. At least that's what the ads suggest.

When the loop frequency is lower than the modulation frequency, you can
use a special technique called "2 point modulation", that is, the low
frequencies modulation components (lower than loop freq.) are injected
in the reference path and the higher ones in the varactor path.
If you have a large gain (df/dV) on the varactor, things become linear
because the voltage swing for modulation is low.
But there are many other ways to get a perfect linear FM without these
problems.

Modulation index for FM is usually defined as deviation in relation to
highest baseband frequency, e.g. with 3.3 kHz audio and 5 kHz
deviation (which would be typical for 25 kHz channel spacing), brings
the modulation index pretty close to pi/2. With deviations suitable
for 12.5 kHz channel spacing (which is the recommendation for 2 m in
Europe) the modulation index would be much less.

A long time ago (unfortunately I do not remember the year), there was
a short article in Wireless World about a VCO with linear tunning
voltage sensivity for low distortion PLL detection of FM signals
around the 10.7 MHz IF frequency. It exploited the nonlinear Vbe/Ic
relation of common emitter bipolar transistors and the varactor used
happened to have the opposite characteristics as the bipolar
transistor. The tunning _voltage_ was scaled down to about 0.4 V ..
0.6 V and it was used to drive the base directly (without any series
resistors on the base). With a normal collector resistor, the varactor
tunning voltage was taken from the collector of the transistor.

I do not remember how the temperature compensation was done, since the
Vbe/Ic curve is very temperature sensitive. Apparently the temperature
stability was not a large issue, since the VCO was inside a feedback
loop anyway.

Also, Ivex has a free ware version of WinDraft and WinBoard
for downloading at http://www.ivex.com/

Both are very good and easy to use, WinDraft does Schmatics,
and WinBoard does PCB layout.

The 100 pin versions are free, and the 350 pin versions
can be had from NTE for $99.

In my references this is called the deviation ratio.

If the max deviation is 5 kHz RMS (7 kHz peak) and if speech is restricted
to 5 kHz then

deviation ratio = max deviation / "MAX" modulation freq.

DR = 7 kHz / 5 kHz = 1.4

Modulation index is:

MI = max deviation / "ANY" modulation freq, for example

MI = 7 kHZ / 0.5 kHz = 14

Paul,

The patent I referred you to previously (US 4,726,069) directly
addresses and solves the problems of "fast fading" as you describe
```

them above. However, the "pilot" is not at 304 kHz, it's mid-band
and actually the carrier, reinserted at a controlled level.

> In FM, you can run the signal through the limiter and the audio
level
> is then only proportional to the frequency deviation, not the RF
> signal level.

True, but it takes much more bandwidth (and power) than necessary
with the SSB-like system. (you have to have enough link margin to
keep the deepest fades from causing the signal ato drop out of
limiting).

>
> However the Modulation Index is the bandwidth (5 kHz divided by the
> frequency of the modulating signal e.g. 100 Hz, or 50 to 1).

Errrrr .... you've got it a bit wrong here, Dave ...

**** excerpted from the ARRL handbook ****
The ratio between the frequency deviation, in Hertz, and the
modulating
frequency, also in Hertz, is called the modulation index where:

Im = D/Fm = P

and

Im = modulation index
D = peak deviation (1/2 difference between maximum and minimum
frequency excursions)
Fm = modulation frequency in hertz
P= phase deviation in radians (a radian = 180°/p or approximately
57.3°).

For example, the maximum frequency deviation in an FM transmitter is
3000 Hz either side of the carrier frequency. The modulation index
when
the modulation frequency is 1000 Hz is 3000/1000 = 3.0. At the same
deviation with 3000 Hz modulation, the index would be 1; at 100 Hz it
would be 30 and so on.
****

In your example of a CTCSS tone, a 500 Hz deviation with a 100 Hz
tone gives a modulation index of 5 (for that deviation with that
modulating
frequency), not 50. A 5 kHz deviation with a 3 kHz modulating tone
would give a modulation index of 5/3, or ~1.666 ... with a 1 kHz
modulating tone, that same 5 kHz devation would give a mod index of
5/1, of 5.0 ... etc.

**** excerpted from the ARRL handbook ****
Given a constant input level to the modulator, in PM the modulation
index
is constant regardless of the modulating frequency. In FM it varies
with
the modulating frequency,
****

In other words, with a fixed peak deviation and variable audio
frequency
(like speech), the modulation index varies all over the place.

Raymond Ware wrote:
> I am reading a Brittish electronics magizine and see the notation 4k7
> for a resistor. Could someone tell me what this value is? 4.7k Maybe?

Yes.

They often use the "k" or "M" instead of a decimal point, also using the letter "R" when no 1000 or 1000000 multiplier is intended. So:

560R = 560 ohms
1K = 1000 ohms
6K8 = 6800 ohms (6.8K)
22K = 22000 ohms (22K)
1M5 = 1500000 ohms (1.5M)

I swear I've also seen something like 0R68 (0.68 ohm) but can't find an example right now. They also do the same thing with capacitors - 4u7 for 4.7uF, etc. They also seem fond of the nanofarad (10E-9F, or 1000pF, often written 1n0) which always throws me...

"PSU", "ATU", "PME", and "RAE" threw me for awhile too...

The absolute best thing you can do for about any screened tube, especially the 4CX250, is REGULATE THE SCREEN VOLTAGE. I use the Plumbers Special on 2-meters and regulate the screen at 360 vdc with a zener stack. Gas regulator tubes like the VR-150 are NOT stiff enough for good IM performance. The tubes gain is HIGHLY dependant on screen voltage.

Raymond Ware wrote:
>I am reading a Brittish electronics magizine and see the notation 4k7
>for a resistor. Could someone tell me what this value is? 4.7k Maybe?

Yes - exactly that.

For several years, most European component manufacturers have been putting the "K", "M", "p" etc in place of that bitty little decimal point, which rubs off components and looks like a fly-speck on schematics.

The full list for "47" resistors is:

0R47, R47 = 0.47 ohms
4R7 = 4.7 ohms
47R = 47 ohms
470R = 470 ohms
4K7 = 4.7K
47K = 47K
470K = 470K
4M7 = 4.7M
etc

You also see the same on capacitors:

0p47 = 0.47pF
4p7 = 4.7pF
47p = 47pF
470p, 0n47, n47 = 470pF, 0.47nF
4n7 = 4.7nF, 4700pF
47n = 47nF, 47000pF, 0.047uF
470n, 0u47, u47 = 470nF, 470000pF, 0.47uF
4u7 = 4.7uF
etc

2917. uA723 temperature drift

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-19 00:00:00 UTC
From: la8ak@online.no
Message-ID: <37e55ecc.175258886@news.online.no>
Source record: 66867

Got a psu from a friend, it uses uA723IC with 1 in driver and 4x 2N3055 in output stage. He claimed it was rated 14V 40A (for at least 30 seconds). But I found it was kneeling for 22-25A, and even worse.... loading it with 10A for 10 minutes the voltage rises from 14 to 15V.
So I decided to look further on his construction. There was no current limit, and few of the recommended guidelines had been followed.

I hooked up a new voltage regulator using MC1723CP in dead-bug technique with thermal compound between IC and PCB groundplane. Running with/without testload with only regulator and driver the reference voltage drifted from 7.2V to 7.9V over the first 5-10 minutes. Motorola claims 1723C to have maximum 7.5V, but I believe having experienced earlier that this is not true.

Is 1723 believed to unreliable, or will a conventional zener diode easily improve this bad temperature drift? I connected a 4.7k resistor between reference in/out with 4.7uF bead tantalum bypass. A 1000uF capacitor with separate rectifier is used for regulator supply, and a 60000uF capacitor is used for the main supply. Rather heavy wires are used throughout the construction

>Does anybody have specs on the KVG model XF-9NB crystal filter and also the
>model YF-9OH 9 megahertz crystal filter?
>

Hello Al,

The published specs on the KVG XF-9NB filter are as follows:

KVG XF9-NB:
Center frequency: 9.000 MHz
# of crystals: 8
6 dB bandwidth: 0.5 kHz
60 dB bandwidth: 1.1 kHz
Passband ripple: <0.5 dB
Insertion loss: <6.5 dB
Terminating impedance: 500 ohms
Ripple capacitors: 30 pF
6:60 dB shape factor: 2.2
Stopband ultimate attenuation: <90 dB

For comparison, here are the specs of the more common XF-9M:

KVG XF9-M:
Center frequency: 9.000 MHz
# of crystals: 4
6 dB bandwidth: 0.5 kHz
60 dB bandwidth: 2.2 kHz
Passband ripple: <1.0 dB
Insertion loss: <5.0 dB
Terminating impedance: 500 ohms
Ripple capacitors: 30 pF
6:60 dB shape factor: 4.4
Stopband ultimate attenuation: <90 dB

The XF9-NB was reviewed in QST for December, 1975 (the last issue in the old,
smaller format.) Results of lab tests verified the claimed specs. They also
measured an XF-9M for comparison. Here are the attenuation/bandwidth specs of
both filters:

Attenuation XF9-NB XF-9M
3dB 400 Hz
6dB 520 Hz 550 Hz
10dB 610 Hz
20dB 730 Hz 960 Hz

30dB 810 Hz
40dB 900 Hz
50dB 1020 Hz
60dB 1110 Hz 2100 Hz
80dB 3700 Hz

If you have any XF-9NBs or XF-9Ms that you want to sell, please let me know!

Unfortunately, I have no information on the YF9-OH filter.

What plans do you have for these filters?

The 723 circuits have been around for years and seem to work very well. Astron (one of the more popular supplys) has used that type of circuit with 2n3771 (think that is the number) for years and seems not to have had any problems. I have a 50 amp version and can not see any voltage change like that. Also have used many variations the uese the 723 regulator and had no problems with the voltage changing.

I think that 40 amps from the four 3055s are a bit too much. Most comercial designs only rate that combination for around 25 to 30 amps.

2923. Wanted: Small Round Illuminated 1Ma. meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-20 00:00:00 UTC
From: DavidC <b4e@earthlink.net>
Message-ID: <7s69lk$r04$1@ash.prod.itd.earthlink.net>
Source record: 66786
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

I am in need of a small illuminated 1Ma. meter that mounts in a round hole. (plus 4 mtg screws). It is going in a homebrew solid state HF Ham amp.

Anyone have one in new or as-new condition they'd be willing to part with for a few bucks?

Thanks! & 73, DavidC K1YP

2924. Converting $20 Electro Mavin GPS unit's uP to NMEA output

Newsgroup: rec.radio.amateur.homebrew

From: Mark Kempisty <NOPEmkempisty@pavcal.com>
Message-ID: <7s6a5e$no6$1@mitl.MITL.Research.Panasonic.COM>
Source record: 66787

Has anyone looked at modifying the Hitachi H8 micorprocessor on the Electro Mavin $20 GPS kit? It seems to me if we could get this thing to spit out NMEA strings instead of its probably propriatary format, the receiver would be compatible with APRS, mapping programs and just about anything else that uses NMEA GPS input.

My logic for this is that the uP is already converting the GPS engine data (for which we have excellent documentation) into what was used for the display unit. (The manual also alludes to waypoint navigation.) So we have 50% of the work done for us.

> single varactor? And for back to back varactors?
>
> Thanks,
> Bert Douglas

Well Bert, the linear-tuning LC VCO is something of a 'holy grail'. FWIW, here's my two pence worth.

Gamma

According to my old Motorola data book, the effective capacitance of a varicap is given by the formula:

Ct = Cp + C0 / ((1 + Vr/phi)^gamma)

Where Cp = package capacitance
C0 = junction capacitance at zero volts
Vr = reverse bias in volts
phi = contact potential (approx 0.6V)

The consequence of this is firstly, that almost no diodes have a high enough gamma to give any chance of linear tuning, and even with ones that have, one is
screwed by the fixed circuit capacitance that is always effectively in parallel
with the diode.

Solutions

I have wasted some of the best years of my life in designing single-VCO FM broadcast transmitters for certain UK manufacturers who shall remain nameless.

Possible strategies for tackling the constant modulation sensitivity problem, in order of complexity, are:

(i) Connect a fixed capacitor in series with the varicap, of value around one half of the diode capacitance at lowest tuning volts. This will restrict the total capacitance swing somewhat, but make the F/V characteristic much more linear.

(ii) Add a fixed-bias modulation varicap to the VCO circuit and proportion the modulation voltage between the tuning varicap and this one to give near-constant sensitivity. This works because as the VCO is tuned higher, the fixed-bias diode represents a greater proportion of the total tuning capacitance, offsetting the drop in F/V slope as tuning volts increase.

(iii) Vary modulation drive as a function of frequency using, for example, an Eprom addressed by channel number driving a CMOS multiplying DAC. Each VCO will need to be individually calibrated and a matching eprom blown.

(iv) Abandon this design approach entirely (!)

On the matter of the PLL tending to 'chase' the modulation at low frequencies, the two-point modulation technique is a very effective solution.

Hope this helps

Edward.

2926. QSL Maker

Hello,

WB8RCR has recently posted a new version of his program, 'QSL Maker' - check it out at http://hfradio.org/wb8rcr/

This is a Windows 95 program, It will not work under Win 3.1. The program has also been used on Windows 98 and Windows NT Workstation 4.0.

- When you first bring up the program, you are shown a dummy QSL design.

- Simply enter your call and address and you have a useable, if somewhat dull, QSL.

- Your call, name and address are remembered for future launches.

- You can adjust the position, color, and font for all the elements of the card.

- You can use a Windows bitmap as a background for your card.

- Once you have the design you like, you can save it for future use. In fact, you can save any number of designs for special purposes, events, etc.

- There are 2, free-form lines for your QRP-L #, FISTS #, 10-10 #, grid square, awards, etc.

- The info block can be removed for those who would like to write this information on the back.

- Dockable toolbars, put them where you want.

- There is a full-blown installation program, and complete deinstall.

- There is extensive help.

- If you use custom colors, they are remembered across launches.

Again, this is software by WB8RCR. Come check it out.

73!

I would like to make some "molded plugs" for this and that
project. Specifically, having failed to track down a source of the
3.5mm/2.5mm stereo molded plug for an ICOM T-8A, and having had problems
with a two plug arrangement, I would like to figure out how to make
them myself.

1) What sort of plastic would one suggest?
2) Is there a better material for the mold than plaster?

Source record: 66791

If you want a regulator that will keep the output voltage constant as current draw increases, and compensate for the drop across series pass transistors, try a 4 terminal regulator. These are much more expensive than a 3 term regulator, but really work well. The type I use is an NTE 953 and costs about $9.

Scott,

Years back, I 'brewed a dual phone plug for my IC2AT.
Perhaps they are similar.... Had or located individual
plugs, no duals though. I made a jig for spacing by
drilling two holes in a piece of wood. Wired the plugs to a
cable and inserted into wood jig. Then, using tape and thin
sheet stock (card stock or plastic) made a "form" around the
plugs... Carefully plugged possible leaks around the bottom
with a tiny bit of RTV using toothpick. After the RTV
cured, filled the form with epoxy. Still works fine.

I have not seen so much obfuscation involving a simple question
on usenet in quite a while.

If you are tuning an LC oscillator, a gamma of 2 gives linear
tuning. Many vendors make diodes that will do this. Some
even exceed a gamma of 2. Some vendors sell "frequency linear
tuning" varactors.

If you are tuning a VCXO, a gamma of 1 gives linear tuning.
Again, many diodes will do this.

Source record: 66794

Back in the middle 60's hams used AM on 2M
(Heath "Lunchboxs"). Taxis, police, fire used FM
on 60 & 30KHz (kcps) spacing, mostly for the
capture effect and quiet operation. The FCC
needing more channels, forced a change to 15KHz
spacing which caused a lot of radios to be obsoleted
to ham use.

Suddenly we had access to cheap VHF radios with
higi Tx power. Repeaters caught on, the Japanese
started building radios (Regency HR2....) and Ham
radio got a real shot in the arm.

> (Oh, linear thingmajig, not switching...)

Unless you switch transformer secondary tappings, you will be stuck with a huge transformer *AND* a huge hot heatsink. If you switch secondary tappings, you can reduce the size of the heatsink considerably, though you are stuck with the big transformer. If you can refine your load requirements, you may be able to trim the transformer size down a lot.

On the other hand, switchmode power supplies are a lot more efficient & with a bit of effort, can be filtered enough to make them useable around radio stuff.

I was amazed on visiting Dayton how little English jargon the North Americans understood. The "PSU" above might explain why there was some confusion when I asked about one. There must be many other examples. I am surprised at the non-use of 4K7. We might need to take more care in projects over here. I hope kilograms, meters and seconds are given the same value, or we might be in for some nasty surprises.

I had no trouble understanding what was said to me, though the rules and regulations regarding when you can turn right at a red light defeated me. I did wonder why a shop was selling a "liter" of coke, until I saw one and discovered what it meant. Why does the same shop sell coke by the Liter and Petrol (Gas) by the gallon ?

The North Americans also had some trouble with English pronunciation, but on the whole it was OK.

>used throughout the construction

If there is a temperature problem with the 723, it is probably being made worse by demanding a lot of current from it, causing on-chip heating. 2N3055s have very poor beta at high currents - how about using a more modern power Darlington device as a driver?

Yes, we are motorised. We also have ARDF which is foot
based, but our Friday night hunts are motorised. On Friday
night, we had 8 hunts and drove 140km. Light-weight
equipment is not needed, except for our runners who
get out of the car and sniff the fox on foot when we
can't drive up to it.

>>We use an ICOM 738 (I think) as the HF receiver.

>not particularly lightweight ....

As I said, it doesn't have to be! :) We use two laptops,
a downconverter, the HF radio, and numerous other
bits of electronics, benchs, lights, motors, cogs and
chains to spin a 5 element yagi. Not really something
you go running on foot with! Keep in mind it takes
about 45 minutes to set up properly!

>fine adjustment of DF-antenna.

This is the usual systems problem of good dynamic range means
less sensitivty! We do have 70dB of attenuation available at the
IF level. If I use the AD8307 with its 25mV per dB, I would
require a DC amplifier after the AD8307 to give me a gain of
10 to bring the full scale voltage up to 5v since our ADC works
from 0 to 5v input.

I'm glad you survived your encounter with the Irrational Colonials. I hope you'll come again and further your education.

Just one tip: Don't ask for spotted dick. You won't like what you get. ;)

To answer your question, I suppose the shop sells items with the strange combination of units for the same reason that the odometers in English cars read in miles but gas is sold by the liter (litre). (My information is a bit out of date -- it's been about 3 years since I was last there. Maybe it's all fixed now.) If you want consistency, you need to go north of here a bit. The Canadians metrified (metricated?) in a very structured way some years ago and did an admirable job of it. It should serve as a model for the rest of us. But alas, politics being what they are, it looks like a long time yet before the U.S. will finally see the light. In the meantime, I'll continue solving problems the old way -- convert to metric, solve, convert back.

Americans generally don't understand nearly as much of other cultures and slang as others do about us. One reason for this is our distance from everyone else, but another is that American magazines, movies, books, television shows, and so forth are a lot more common in other parts of the world than those things are here. And that's largely because of this country's size and population. But I hope you found that most people you met were eager to learn, as I am.

Use a variac on the front end - this way you can control the rectified and filtered voltage going into the sense and error amp, which could be an adjustable series regulator like the LM317. The power dissipated by the regulator is thus minimized. Of course, you have two knobs to twiddle - the Vadjust on the LM317 and the Variac.

I use a power darlington to handle the current, but only because I had one lying around -

Not begin a power supply designer I was toying with the idea of varying the duty cycle on an SMPS to control a voltage. However, where do I derive my error signal to feedback for regulation? I suppose that if I set the pulse width digitally I could use an adc to feedback an error signal, I'll have to put a PIC in there to make sure that the thing doesn't turn into a high power oscillator!

Also, for low current situations, it would appear that one needs a pretty large inductor - or you have to load the SMPS all the time.

Wrong way around. You need to look at what the saturation flux density is,
and that comes from amps and turns. (1G=1A1T)

You can move a lot of watts through a little material, if you switch fast.

> Does anyone have any reference material or thoughts on problems with a

alt least 3 approaches to be used.
You do not say what the tuning ratio will be by the way is it 2:1 or
1.1:1 for instance.
If the range is relatively small you can regard a narrow part of the
curve as linear.
The professional solution for a large range is to store a look up table
to modify your modulation drive dependent on where you are on the curve.
Generally the highest junction gradient will give most linear result but
it may be possible to arrange a network of l and c incorporating the
varicap that tunes out stray capacitance at the high frequency end
therefore at maximum frequency the (equivilent series) network
approaches parallel resonance ie zero capacitance.
You always have the possibility of deriving your local oscillator from
mixing a higher frequency vco down to the required LO frequerncy and
applying modulation to the (fixed) oscillator.

Hi John,

I've had some experience designing DC/DC converters, and the trouble with HV output is leakage inductance in the secondary. This is caused by the relatively large number of turns needed to get the high voltage. Also, you get problems with high secondary inductance and interwinding capacitance creating ringing. This can place an upper limit on the switching frequency you plan to use. The partial solution is to use a large core and put insulating tape between the winding layers.If you have a split secondary, wind the two halves on different parts of the bobbin, preferrably separated by a using a split bobbin. Bring out the HV ends on "flying leads"; don't bring them back to the lead frame of the bobbin. A better solution would be to "bunch" the secondary windings together, somewhat like an RF choke is wound. You would need to find or make a special bobbin to do this. Good luck!

Howdy,

You are invited to my non-commercial, sometimes boring, hopefully useful, and always-undergoing-updates website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; Propagation Center including the eAlert service (allows you to sign up an email address to the automated email propagation reports); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

>
>Considering this product was aimed at the consumer market
>
>

Thanks for the pointer, Woody. It does makes interesting reading and indicates a possible avenue for the integration of tv tuners into future consumer equipment designs.

I suggest you start at:

http://www.microtune.com/index.html

That page has the "Newsflash" box that leads to the "kit". 'Splain to one and all how come you determined it was a "consumer" product and why the price surprised you when, if you read carefully, you would have read the following at:

http://www.microtune.com/news/092099c.htm

Price and Availability
The NTSC Designer's Reference Kit, order number MT2000-RD-NTSC, is available now and priced at $1895; the PAL version of the Kit, order number MT2000-RD-PAL, is also available now and priced at $1995. The Microtune PC Convergence Reference Design, order number MT2000-PCTV-NTSC is available now and is priced at $2495.

Nowhere in their promotion did I find anything that even suggested the kit was aimed at the consumer market. All I read indicated it was a designer kit for OEM engineers. I know my amateur and professional qualifications do not count, and I would not have been surprised at his response. I would not have taken offense and posted my indignation before reading, completely the introductory web pages.

He knew, immediately, that you were of no consequence to his business and you were wasting his time. You sounded like an amateur to a business that caters to professionals. Been there and done that, on both sides of the phone. I might have given him a C for bedside manners, but then again I haven't an idea how many calls he got from other people that didn't read

before they called. I do not know how much of his time was wasted explaining what was written in plain English. It does get exasperating and expensive fielding inappropriate calls while other calls from qualified buyers are on hold. ;-)

I would guess, an educated guess, that the CPU on the board is either a one time programmable, or a masked rom programmed chip. This precludes using the chip included on the board itself for this purpose. It might be possible to replace the CPU with another programmed with the correct code. It might even be possible to read the program on the included CPU to cut down on the programming time, but I have no experience with this CPU.

Therefore it might be possible to reuse the board and even some of the programming, but not the chip itself unless it is flash programable.

Aren't the high TX power and FM related to each other? With FM, you
can generate the modulated signal in low-level stages, then amplify
it to the necessary output power use efficient class C amplification.

With AM, you either have to modulate in the high-power stage (requiring
a high-power linear audio amplifier), or you modulate in a low-level
stage and then you need a high-power linear RF amplifier, which is
inefficient.

Hey fellow DJs and audioheads...

I can't believe I found what I have been looking for so long!!!! ....

A decent DJ program that does everything you really need and with style.

I'm sick of DJ programs that promise the earth but are too impractical to even consider. Well, now I've found one that truly does what it claims.....

OtsJuke DJ fully handles volume with a built-in AGC, compressor and limiter!

Plus it actually does decent mixes using auto-detected points. It's got this program which you run on ya MP3s and it calculates it all for ya while ya sip a coffee. Buggered if I could be stuffed putting them all in myself anyway.

And there's no 2 second latency issues. Volume, pitch and a tempo shifter all respond instanty. And tis got a 20 band GraphicsEQ in it too, and unlike most it responds instantly!!!!

if anyone figures out how it works out the beat in the song let me know. I thought that was impossible.

I think the best thing is the clear interface it so simple - it's just too easy. with all this extra time saved I guess i'll have a chance to become a bit more creative in my work.

It says on the web page it only got release on the 9/9/99. Must of been a product of all those supposed malfunctions, actually going well! All the good karma made this cool DJ/radio program.

Anyway if ya interested go to http://www.otsjuke.com

The demos pretty quick to download.

Chow,
DJ Rail

Its probably OTP as it has a sticker with version and partnumber info attached to the top. (Lord knows I've programmed enough ROMs at my last job and have done the same thing.) However, I too have not worked with H8 and have only scratched the surface in researching this chip. I'll post when I find out some more.

I'm betting we will not be able to get any info from the company that originally created these boards as they sold them out in bancrupcy. So that means disassembling and reverse engineering the code to get the sections we need. Not an easy job. We could start from scratch as we really don't need a lot but we need to find an H8 assembler or compiler on the cheap side.

Howdy!
I need an aluminum chassis 3"x7"x12" for a homebrew
6l6/807 transmitter I'm building. Can anyone help me
out ? Please reply with price to kx4r@mindspring.com

Tnx and 73, Greg KX4R

2955. Re: ATV Rpt / Microtune / Rude - too bad

Pete, you are correct..... and you are incorrect.

It is frustating some times to have to tell 3 or 4 people a day that we don't do that or we can't help you. In my role as technical assistance I often get calls from people who can't find what they want and aren't going to find it here either (if you've looked at the web site you know we don't have it so go away). We also get a lot of calls asking for PCs or repair on PCs since the name of our company is very similar to a PC supplier out of Ohio. We always tell them that "that ain't us but here's the number you can call". We're always polite (well... except to that guy in Texas but jeez what an idiot). and try to help even though we know we aren't going to see dime one. After telling a fellow (4th in one day) that we didn't do PCs he then ask me what we did do, I replied that we build embbeded control systems, he said hmmmmm..... then we chatted for a few minutes, I gave him the number of the PC place and we said our good byes. A week later I get a call from a guy who says he's the friend of the fellow that called me earlier about getting his PC repaired and wanted a catalog. He's now a regular customer of ours.

Here's some thing that happed to me. About 6 years ago I helped a profesor up at the local campus with an imagining system. I was having all kinds of trouble with hard to use and poorly documented software. I called the company and was informed that since the system was so old (5 years) they couldn't support it but would gladly sell me a new system (at twice the cost of the old system). The money was not in the budget so I had to do it the hard way. A few weeks later I ran into a brick wall and out of desperation I called the company back. The sales engineer remembered me and replied to my question that "if you don't want to buy, your wasting my time", and like Woody's sales guy he then hung up on me. Well I finaly wrote my own software. Took me a couple of months and a lot of cussing but I did it. And every time I cussed I directed my words at said company and sales engineer. Five years later I get a custom order from a company wanting to do about the same thing that my profesor friend wanted to do. Even though I new the rude companys equipment very well I found another vender who had about the same stuff but with nicer people. It took me about an extra two weeks to come up to speed with the new venders equipment but to me it was worth it. Next year my firm will be spending six figures buying equipment from the nice guys.

You could say that the point here is to be polite because you "just never know" but the real point is that it doesn't cost any thing to be polite. Is an extra minute on the phone really going to cost you a multi-million dollar account? Personaly I'd rather send someone away dissapointed then mad.

My $00.02

Rick

You can make virtually anything like this from fiberglas and epoxy resin - can't even tell that there were holes in my daysailer!

I inherited a Kantronics KPC 3 from my father in law, and I cant find anything that goes with it.

I need to get
1. Copy of a manual and instructions
2. I need to know where to get the software for it
3. What type of AC adapter goes on this unit
4. How to wire up the cabling to a PC
Any and all help would be greatly appreciated
Thanks

wrote:
>I would guess, an educated guess, that the CPU on the board is either a
>one time programmable, or a masked rom programmed chip.

Under the sticker on that CPU it says:
H8S/2246
7L1 I
472246FA20
Japan

From Hitachi's site it appears to be a CPU with an internal 128K byte
mask programmable ROM. It might be possible to run it in a mode
with an external ROM.

See
http://semiconductor.hitachi.com/h8/?adjump=frontpage_products-section

The key to finding things on this chip seems to be to
look for H8S/2246 in the titles.

The hardware manual might be:
http://semiconductor.hitachi.com/products/pdf/h82th002d2.pdf
(beware this is a 3.4 MB PDF file).

>This precludes

Hello--

If you cracked a blown, blue-cased CK722 open, inside you'd find an
even smaller transistor-- one of Raytheon's rejects intended for
hearing-aid service!

I can recall saving several weeks' worth of newspaper-route earnings
to buy transistors, and especially the Philco MADT hobbyist specials.
These offered good RF performance but featured low collector current
ratings and thus made excellent fuses<g>.

I just built a transmitter using a 12BY7/1625 combination. I used a cake pan for my chassis. I had to trim it up a bit but with a pair of tin snips and a pop rivet gun I got it looking pretty good and it only cost me 50 cents (got it at the Goodwill).

2962. Help With CCTV Camera?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-21 00:00:00 UTC
From: DavidC <b4e@earthlink.net>
Message-ID: <7s8h30$4cl$1@holly.prod.itd.earthlink.net>
Source record: 66812
Cross-posted to: alt.ham-radio.atv,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a Panasonic CCD CCTV camera model WV-BL202.
The Panasonic label says Output Video 1Vp-p 75 ohms.

It has a Cosmicar Television Lens 16mm 1:1.4 with F-stops
16, 11, 8, 5.6, 4, 2.8, 2 and 1.4.

It runs on 12vdc, has a BNC connector for "Gen Lock", a
switch to turn AGC on and off, and another that has "Auto Iris"
above it and DC Video" below (though curiously this switch moves
left to right so it is unclear what it is selecting).

There is a second BNC for "Video", and a ALC control on one
side and a square four pin connector on the other (unlabeled).
On top is a 1 1/2" x 1/4" metal strip held in place by a screw.
There is a label next to it reading "OFF ON G/L 75 Ohms".

So, what do I have, please? Sounds like a monochrome
camera with a very wide angle lens. But after that what do I
need to know about using this for ATV, SSTV or as an Internet
cam camera on the tower or as a security monitoring camera?
What sort of interface would be required, etc?

Thanks for information, or referrals to a source of information.

Source record: 66813

The Feb. 1991 issue of QEX has an article on a switching power supply providing 2000 volts out at 1.5 amp. Pretty complete electrically with complete schematic, parts list and theory of operation. There was an errata sheet in the Aug. 91 issue. QST advertizes a CD ROM of all QEX issues up to Dec. 1998.

The PS weight is 8 pounds, ripple of less than 2 volts and load regulation less than 100 volts.

Hope this helps.

Hi Rick,

You are correct by suggesting that a little more politeness may have been due, that's why I considered giving the lad a C for bedside manners, as the story was told. Without being a witness to the actual conversation I would not pass judgement. Human nature has a mean streak that will, often, call for summary execution for a perceived slight that does not exist. I have bent over backwards for customers but was unable to provide the "magic" they sought with no guarantees given or implied from the beginning, at no cost to them. For that and other non productive help, I was labelled lower than whale feces, many times. No matter how hard you try, within the context of rational behaviour, you cannot be all things, to all people, all the time.

With a vast difference in knowledge concerning technical matters
it almost impossible to communicate. Ignorance begets fear and almost any irrational reaction is possible as a consequence. I have witnessed it innumerable times in "over the counter" business and local politics.

Unconditional "satisfaction guaranteed or your money back" has further corrupted a basic tenet of life; the acceptance of individual responsibility for the consequences of individual action or inaction. The search for the free lunch is part of our nature, and those that stand in our way are seldom the recipients of good will ;-)

Sounds more like philosophy than homebrew!!!!

Hi,

I am looking for a diagram to build a HF lineair amplifier, I prefere to use a one tube solution that delivers me the legal limit for Holland which is 400 watt.

If you know a suitable diagram somewhere on the web or in the literature, please send me a message.

Nuts and Volts did a thing on this about a year ago or so, I just moved and all my back issues are still in boxes but as I recall the article took you from taking a cast of the original (not plaster, some kind of rubber/flexible plastic) and then pooring a new cast. Don't remember the issue but if I run across it I'll let you know.

If you want store-bought, I like Mouser:

http://www.mouser.com/catalog/cat_599/339.pdf

BTW, what circuit are you using? Why, if I may ask, are you using a 6L6 oscillator? I only ask because there are better (i.e. lower crystal current) oscillator tubes around, such as the 6AG7, 6CL6, 12BY7, etc.

I'll butt out now <g>

You are right. I did not think of the possibility of a mode which would disable the internal ROM and use only external memory. This mode does exist, and as there is a blank IC pad area on the board it might be relatively easy to leave everything alone except a new program and and additional IC. Thanks for the idea.

A propriatary processor I have used previously had internal ROM that could be shut down at reset so external ROM could be used. I'll review the H/w doc and see what it says. This thing would make a great APRS tracker.

I will also try to scan the standard output from the board. The only information that I have from Electro Mavin is that it did not match the manual. But it could be NMEA though my gut tells me it isn't. If somebody beats me to this, I promise to not get upset ;-).

I just reviewed the PDF H/W manual and we can definitely disable the internal ROM and run the thing completely from an external ROM. The H8S/2246 has 128K of internal PROM. My guess is that the manufacturer was going to switch to H8S/2245 (ROM) when they had high confidence in the firmware to get the cost reduction the ROM based chip offers.

There appears to be GNU based tools including a C compiler for the H8 that can run under Linux.. Unfortunately I did not save the URL but will look for it tomorrow.

This is looking good.

Pete,

A "C" in manners???? I am more respectful of tele-marketers interrupting my dinner!!!!!

Apparently you did not read everything carefully (either?). I did miss the price note. Had I seen that, I would have immediately written them off as unreasonable. I could buy cable head-end equipment cheaper than that experimental board. Also..My link was intentionally not to press releases, but to the deivce about which I was refering.

OTOH, for example...
Quote:

Jim Fontaine, executive vice president of sales and marketing at Microtune, Plano,
Texas, speculates that this compact, low-power receiver also will enable a type of
wireless web appliance which pulls digitally
broadcasted Internet data streams off
of subchannels embedded in the new broadband digital TV signals. Microtune's
co-founder and chief technical officer, John Norsworthy, envisions a personal
digital assistant (PDA) or palmtop that is equipped to receive and filter these "push"
transmissions, providing users with messaging, news, financial, or general
information. Developments such as this are only now commercially feasible with the
cost, power, and space savings that an integrated tuner offers.

There are a number of other releases describing the circuit as being more cost effective than discreet component tuners. Would that lead one to think the development circuit alone would cost more than 3-4 "palmtops"? Don't think so...

The parts will never fly for that application priced such as they are. The "kit" not withstanding.
An example of more reasonably development boards can be seen at Analog devices. They are not cheap, but not unreasonable. Certainly the "kit" is not aimed at comsumers, but their application of the device covers that

area - per their statements. Again, one would expect a
device to be applied to comsumer technology would carry
consumer-like pricing.

I would think that getting such calls is a fact of life.
Furthermore, as ham homebrewers, technology that is
researched independently is often introduced into commercial
products. It is not *always* a dead end. It is a risky
assumption that whoever calls and dosen't immediately order
10,000 pieces is of no consequence.

Regards, Woody

Sorry Pete --

I don't care how much product information is published,
or where it is published, or how many calls you get about it
each day -- NEVER be rude to the customer or the public.

Woody ir right. The guy was rude and I thank him for telling
the rest of us, commercial or amateur, about them.

Our company does do TV and video work (not broadcasting)
and we avoid the likes of Microtune. There are too many companies
willing to do business out there.

What does that have to do with a 723 ? The 723 regulator has lots more
than 3 terminals. More like 14 pins.

Wow! Thanks, Jim! Exactly what I wanted. I think I have the parts for the style rectifier(s) and filter you mentioned. And I assume with a small bleeder load that would net almost 750watts ICAS. As a class C final on CW, it could probably handle a single 813 key down for a minute at a time, but don't you think it could handle a pair of 813s in AB1 in SSB linear service? Again, thanks for the help. It has been bugging me for weeks!

If the pots have the typical "duo-dial" or similar counting
type... Loosen the setscrew and pull off the knob. This
will leave the rear portion of the knob assembly on the
panel. At this point, you should see the pot bushing nut.
It holds both the pot and the rear portion of the dial -
with the panel between. Loosen the nut... Voila! BTW,
look carefully at the setscrew. Sometimes it is a hex
allen, but often is a Bristo (sp?), which is more like a
spline.

>beats me to this, I promise to not get upset ;-).

The "programming manual" available on the Electro Mavin website details the output of the GPS receiver module, not the entire assembly. I have written a program to decode the receiver module's output that runs on a Z80 microprocessor. It seems that the various example programs use the mainboard's output, not the receiver module's output.. I judge this to be the case because the "standard" modifications I have seen all use the output of the mainboard's processor and that is the data format that doesn't match the document.

Hi Group
My recolection as to price was $7.50 I believe CK721s were a bit higher. In the mid 60s I tried some of them in a modern properly biased amp circuit. I couldn't believe how noisy they were. I still have them along with a few GE 2N107s. I thought I died and went to heaven when a friend dropped out of school and went to work at Airborne Labortories in LINY. Suddenly we had a supply of silicon 2N697s. They would actually make useful power on 10 mtrs.

>transformer? My once complete stack of catalogs has been eroded by time.
>I acquired this transformer years ago for a planned linear amplifier. I
>think the plan was for 115vac in and enough out for a pair of 813's
>grounded grid. Well, the data plate's total technical data is "300ma".
>Fine! A little more would be helpful!
>Anybody with time and resources to help?

From the 1953 RESCO catalog:

Merit P-4062:

Primary: 115 VAC, 60 Hz
Secondary: 2900-0-2900 VAC (high tap) or 2385-0-2385 VAC (low tap), 300 mA.

This unit was designed for use with mercury vapor rectifiers (a pair of 866As, usually) and a 2 section choke input filter. The resulting DC output would be 2500 volts on the high tap and 2000 volts on the low tap, at full load. Works out to 750 watts on the high tap and 600 watts on the low. It will run cool if used with a single 813, but I wouldn't push a pair of them to full power using this iron in the supply.

1953 price was $48.

Hope this helps!

I'm looking for some ideas.

I want to do some experimenting with 2 meter antennas and need quite a bit of ladder line. Since this is just a short term experiment and will not be permanent, I really don't want to be spending .15 to .20 a foot on commercial ladder line.

Consequently looking for a cheap insulator/separator ideas so I can make my own ladder line.

Thanks,
Jim

Traditionally, hardwood dowels boiled in paraffin wax were common; it's cheap
and effective.

You say you want to use it on 2 metres? The moonbouncers that use open line
for their arrays use teflon, placing the teflon spacers at current nodes every
half wave ~1M. It's works as well as hardline (except in freezing rain) and is
considerably cheaper.

> Where did you tap off the signal from receiver module?

One of the mods from the web site shows how to take the TTL level output from the receiver and with a couple of cuts and jumpers run them through the level converter on the main board so that you can connect up to an RS-232 serial port.

The unmodified RS-232 output from the main board is used to drive the display module. That is the interface that there is no spec available for (that I know of).

I have written some Java code that decodes the receiver output. Next step is to get it running on a TINI (http://www.ibutton.com) web server so that it can be used as the reference for a network time server.

What example programs? Tim Laren's program uses the raw GPS engine data
which we have documentation for. I am curious to see what the data from the
main board processor (an H8) looks like. If its NMEA we're in good shape.

As I understand it, the board mods have been to bring the TTL data from the
GPS engine out through the RS-232 level converter and take the H8 out of the
loop.

It's not exactly what you are looking for, but have a look at:
http://www.qsl.net/ei9gq/amp.html

It uses a Dutch QE08-200H tube. If you add a second tube, it will easily
run at more than 400W.

> So, what do I have, please?

We'll take it one at a time:

> I have a Panasonic CCD CCTV camera model WV-BL202.
> The Panasonic label says Output Video 1Vp-p 75 ohms.

The video that floats around in TV stations is one volt peak to peak. What that means with a white video screen, the points to the bottom of sync to the top of the white video is one volt. 75 ohms is the Z of the video line. Just like CATV is 50 ohms.

> It has a Cosmicar Television Lens 16mm 1:1.4 with F-stops
> 16, 11, 8, 5.6, 4, 2.8, 2 and 1.4.

The F-Stops are simply a way to either close or open the iris according to ambient lighning on the subject you are shooting.

> It runs on 12vdc, has a BNC connector for "Gen Lock", a
> switch to turn AGC on and off, and another that has "Auto Iris"
> above it and DC Video" below (though curiously this switch moves
> left to right so it is unclear what it is selecting).

Gen Lock is something you don't need to worry about. That is how you lock different video sources together as in a TV studio. You will want the AGC and auto iris on. DC video is clamping. It keeps the DC level of the output video at a constant level. That is something you don't have to worry about either.

> There is a second BNC for "Video", and a ALC control on one
> side and a square four pin connector on the other (unlabeled).
> On top is a 1 1/2" x 1/4" metal strip held in place by a screw.
> There is a label next to it reading "OFF ON G/L 75 Ohms".

Video is the output of the camera. I'm assuming the ALC is a pot. I wouldn't worry about it either. The spuare pin connector sounds like an S-Video output, but since the camera is monochrome I don't see where it would use it. The label is referring to the switches on the side below it I'm assuming.

Sounds like you have a good camera for remote use. I have a similer camera that I am thinking about placing in my Jeep facing forward and feeding to an ATV transmitter. I have to get the transmitter, first.

Hope this information has helped.

Scott

I'm sure we all did that at least once. I learned to make a little wood or plastic spacer with three tiny holes to slide against the case. When the lead inevitably broke, but flush with the spacer, you could remove the spacer and use the transistor for a while longer before the lead finally broke flush to the case.

Yes, now that you mention it, we have "paraffin lamps" here in Canada, but
we also have paraffin wax, go figure!

And yes, boil your dowels (and cast bullets, for that matter) outside!
Dangerous fumes, in both cases.

I've just made some open wire feeder, using the plastic clip-on spines
used to clip sheets of paper together.
For the size of paper most used in the U.K. (A4), they are about 11,5
inches long. I'm sure that you can get the same im in 'letter' size.

Cut them into approx. 2.5 - 3 inch lengths, make a hole with a hot
bradawl about 1/2 inch in from each end, slide onto wire about 12 inches
apart and fix with adhesive.

Quick, cheap and simple.

Hi All,

After a successful 2 meter J-Pole project I decided to build a 440
J-Pole and
having problems with the feed point. I am using the same technique which

i used for 2 meter but no success. when i start moving the feed point
from bottom to top SWR meter showing that my output power is changing. I

know this can happen because of the impedance change on the feed point.
I do not have lots of test equipment to find the feed point.
After unsuccessful 440 J-Pole try I try to build another design 440-450
Omnidirectional Antenna (73 Amateur Radio Today November 1994 page 22)
same problem.
Any sugessions ?

Thanks in advance

3007. Re: Converting $20 Electro Mavin GPS unit's uP to NMEA output

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-22 00:00:00 UTC
From: "Laszlo I. Morocz" <kf4pv@SPAMMENOTlmorocz.com>
Message-ID: <r%cG3.2609$WO4.4296@jump.innerx.net>
Source record: 66758

OK John, that's where my tap comes from, too. Just wanted to verify that that's the GPS engine directly. I used Time Laren's mod (very nicely documented, BTW) to get the level-converted data. However, it does not match the programming manual exactly. Close enough that I was able to write my own driver/navigation program, but there are significant differences. For example, the 3 bytes in front of the validity code (pg 34) match nothing in the documentation. The first byte isn't even mentioned, while the 2nd varies between 0xBF and 0xB0 (depending on the number of satellites) and the 3rd byte ranges from 0x28 through 0x2A inclusive. The manual documents the 2nd & 3rd bytes as a control code with values of CACA (wonder if that's a hint?).The rest of the bytes are pretty much as advertised. So I was hoping that a different tap point would match the manual better, which is what Martin, WB6YMI, seemed to be implying.

On the other hand, I've managed to write a program that displays the various data, as well as range and bearing to waypoints. It's a very usable board, indeed, especially if you're willing/able to write your own software.

The biggest hurdle I've found to NMEA output has been the neanderthal attiutude of NMEA. Instead of encouraging people to use their standard by publishing it on the web, they want $65 a pop for it. The only NMEA-related things out there on the web for free are a couple of example string formats, nothing about the protocol dynamics at all. Guess they're taking Microsoft lessons from Bill.

As far as the H8 stuff goes, for me personally it's a lot more cost effective to just put the conversion routines into an Atmel AVR chip daughter board. We're looking at the difference between:

a. cobbling up some floating point code, a sine, cosine and arc-cosine routine and some glue;

b. learning a new processor, figuring out how to disable the internal ROM, adding an external ROM and possibly disassembling the existing code (just in case it's performing some kind of startup initialization that's vital to the operation of the GPS engine).

On the other hand, don't let me stop anyone else from trying it. I'd be very interested in the results if someone manages to get it working.

This is a great board, thanks to whoever it was that brought it to our attention.

73 de KF4PV/3, Laszlo

PS - A Radio Shack 2-position dual row barrier strip (274-656) happens to fit exactly in the empty area to the left of the DIN connector on the GPS

board. I attached it with Radio Shack Hi-Temp/Hi-Strength Supermount tape (64-2361) and then ran power and ground wires from the solder pins under CN1 (through the mounting hole behind CN1, parallel to the wires in Tim's mod and to the back of the barrier strip). Now I make power connections to the barrier strip. This is very much more robust than soldering power lines directly to the CN1 pins, and allows the swapping of different kinds of power connectors (cigarette lighter, wall wart, batteries, etc.) with just a screwdriver.

That's interesting, A friend from Silicon Valley once told me that the 2N2222 is a similar animal. At the end of the production line, if a transistor doesn't qualify to be something important, it gets to be a 2N2222.

I've picked up a piece of surplus instrumentation gear (seismographic) which has 2 Beckman 50K multi-turn Helipots. The knobs have what appears to be 1/32" allen screws - that's no problem since I have the right allen wrench. However, how does one remove a Helipot from a front panel?. Any advice would be appreciated.

>3. You need a 12v, 300-500 ma power supply.

The manual says the KPC-3 runs on 6 to 25 volts at less than 40 ma;
if you turn off some of the LED's, it'll run on a 9-volt battery
at about 15 ma!

The Cambridge & District Amateur Radio club are on the lookout for club project ideas. Ideally things that can be built in an evening and are low cost and low parts count.

Does anyone know of any simple QRP designs along the lines of the pixie2, but for SSB use.

Its going to be my next project. Good luck ! Mike N2JVT

3025. Decibel 'References'.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-23 00:00:00 UTC
From: Terry Sanford <tsanford@roadrunner.nf.net>
Message-ID: <37EA2835.3D53@roadrunner.nf.net>
Source record: 66773

I hope this is not too far off the subject but can anyone direct me to a handy reference for 'decibels'.

Decibels (dbs.) are of course one tenth of a 'Bel'; which are named after Sir Alexandr Graham etc. and are the logarithmic ratio of two powers. For example if you double the power (times 2) and you take the logarithm of the number two (2) you get 0.30102999 etc. Bel./ and that is 3.012 decibels.

This leads to the well known saying "doubling the power is 3 decibels". Oops, sorry 'PLUS' 3 decibels!

These days one hears such things as 113 db. can damage your hearing, OR; interior noise is 70 db.;
But in reference to what?

I recall the following;
1) dbm. in reference to ONE MILLIWATT; commonly used in analog telecommunications.
2) dbw. in reference to ONE WATT; sometimess used by radio amateurs?
3) dba. (decibel adjusted); a 'weighted' measurement sometimes used in reference to a a level somewhere down around -90dbm. to measure circuit noise levels.
4) receiver noise figure = 7db (say).
5) dbrnc. (decibel reference noise .....) recall this as an 'unweighted' circuit noise measurement with a 'floor' down around -93dbm.
6) dbs. in reference to 'aspl' (which I understand means audio sound pressure level at a certain distance from the transducer/speaker) with the heavy audio crowd.
7) Also can understand that a radio propogation path can "have a a LOSS of 110dbs." In other words a signal can start out at a level of, say, +30dbm due to transmitter power output, antenna gain and transmission line loss and arrive at the other end of the propogation path 110dbs. weaker. That is at a LEVEL of -80dbm.

So if someone says to me that's +12dbm I have no problem visualizing a signal etc. that is 16 times stronger than one milliwatt!

But if someone says they can get 110db from their car audio sound system (and presuming they mean +110db?) I'm wondering 110db in reference to what (Or watt? If you'll excuse the pun).

Anyone care to comment, or enlighten or direct to appropriate source.

Source record: 66774

Hi all.
Laszlo I. Morocz wrote in message ...
>Where did you tap off the signal from receiver module?

I got the data as it exits the receiver module itself. Here is the pinout for it:

J201 Connections
1
2
3
4
5 GND
6 Backup battery +
7 +5 VDC
8 GND
9 Data from RX (TTL level, not RS232)
10 Data to RX (TTL level, not RS232)
11
12
13
14

Other pins are also used but I don't know what they are.

It is not really necessary to implement bi-directional communication with the receiver module as it defaults on power up to sending the C3C3, C4C4,CACA and CBCB messages once a second. This info is sufficient. The other commands and responses don't seem to be required to me for "normal" operation.

The data that comes out from the receiver module exactly matches the "programming spec" PDF document on the Electro Mavin website, at least as far as I have looked.
Hope that's helpful

Bels were originally developed as a measurement of sound intensity,
their application to radio signals came later. If I recall properly
(and this deserves double-checking) 0db was defined as the threshold of
audibility. (whose ears? I have no idea. Presumably it has since been
redefined in some other more reproducible terms.)

>Martin, WB6YMI, seemed to be implying.

I get the C3C3, C4C4,CACA and CBCB messages as advertised. I really don't
think that you are tapping the same place that I am if you don't get them.
I picked up the data off the small SMT filter as it exits the receiver
module and before it reaches the mainboard's microprocessor. I haven't
implemented sending to the receiver module as I don't have the need for the
data in any of the other messages.

>The biggest hurdle I've found to NMEA output has been the neanderthal

>lessons from Bill.

I noticed the same thing but, for an organization developing a product,
$65.00 is virtually free. Go out and price, for example, the SCSI specs.
I'd view the $65.00 as a membership fee into the "club." I don't think they
are trying to hold back guys like us. Furthermore, I seems that only the
GGA, GSA,GSV NMEA sentences are required and these are 'findable' on the
web.

>a. cobbling up some floating point code, a sine, cosine and arc-cosine
>routine and some glue;

Why floating point and trig functions? What would you be calculating? My code uses 40 bit fixed point arithmetic to convert hex lat, longitude to decimal. Not good enough?

As for me, I'd ditch the mainboard processor and do the conversion in the target system, anyway. Can't the serial port be intercepted, converted then faked (as though it came in a serial port) to the target program?
Then you don't incurr the added serial line delay. (I won't go into my tirade again, you probably have read it on previous posts on the $20.00 GPS)

In audio, the 0 dB reference level is usually 20 ï¿½Pa sound pressure or
1 pW/mï¿½ sound intensity, which happens to be coincident (within a dB
or two) with the threshold of hearing for an average human around 1000
Hz. Thus, the normal atmospheric pressure (101.3 kPa) would correspond
to about 194 dB and 120 dB would be 1 W/mï¿½.

Message-ID: <7scl0h$g7v$1@new-usenet.uk.sun.com>
Source record: 66779

My analysis of the data stream from the receiver is:

1. a 'packet' of data is sent every second

2. the packet uses 0x10 as an escape character

3. the packet begins with 0x10 followed by 0xbf when there are no satellites being decoded and the data is being generated from the battery backed up information.

4. the packet begins with 0x10 followed by 0xb0 when 1 or more satellites are decoded.

5. the third byte is the length of the packet excluding the checksum byte and the trailer (0x10 0x03).

6. the length varies because if the data contains 0x10 it is escaped with with another 0x10 (which will happen at lease with every record that is sent when the time is 10 seconds after the minute because the date and time are in BCD).

7. the data (after removing escaped sequences, header, checksum and trailer should be 40 bytes and corresponds to the data in the CACA message described in the software document.

Note that if you pull the cable connecting the receiver to the main board, you will disconnect the 3.5v battery backup and the receiver will be reset to it's defaults with a lat/lon in Japan and a date/time of 00/01/01 00:00:00. It will then take a while to get a fix again.

So far, I have not tried to send a command to the device, and I have not looked at the other serial output which is for the display board.

3033. TRF chip needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-23 00:00:00 UTC
From: artky1k@northlandlink.com
Message-ID: <37ea7110.25702595@news.tds.net>
Source record: 66781

Hi Everyone,

I need a source for a TRF receiver chip.

The numbers are ZN414, ZN416 or MK484. These are 3 terminal chips
that run on 1.8 volts @ low current and are usable from 30 khz through
1.8 Mhz.

I have no other information.

If anyone knows of a source for these chips or an equiv type, I'd
appreciate knowing too.

email response preferred-

Thanks,

Art

0 dB sound reference level does indeed correspond to the threshold of hearing exhibited by young people in the audio frequency range of 1,000 to 4,000 hertz. I do not know who made this determination or how it was made but I would not be surprised if Bell Labs had something to do with way back when. However, this is conjecture on my part.

0 dB has a more technical definition. It is the sound (air) pressure level of .0002 dyne/square centimeter. This is the same as a power of 10 to the minus 16th power and is expressed in watts per square centimeter.

At this same threshold of hearing, the molecular air displacement causing the sound at a frequency of 100 hertz is about 1/10,000,000 of an inch.

At 1,000 hertz, the molecular air displacement is about one tenth of the above.

While at a frequency of 3 to 4 kilohertz, the air displacement is about one tenth the diameter of an air molecule! Amazing

While interesting, sound level are not determined by air displacements but by sound pressure as explained above.

The ZN chips were made by Ferranti (UK), who were taken over by GPS,
who discontinued their production some years ago. I think I've seen
them on sale from surplus outlets from time to time.

Several articles for doing just that have been in EA and Radio
& Communications earlier this year. Essentially they start off with
230 or greater SMPS and rewind the transformer for 14V instead of
5V.

I am collecting old power supplies! :-) At the very least you will
learn a lot.

3040. Ham Radio and SWL URL

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-24 00:00:00 UTC
From: nw7us@hfradio.removethispart.org
Message-ID: <%5IG3.412$1C.7998@sea-read.news.verio.net>
Source record: 66690
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Howdy,

New content is being added this week. Check out the SWL links, the DX news, or the Propagation Center.

I've moved the QSL and Callbook section off of the main page and onto a page dedicated to just this information. And I've added a lot more to this section.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

3041. Wanted: dead 51J-4 mechanical filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-24 00:00:00 UTC
From: Bob <XYZ_p15218@flash.net>
Message-ID: <01bf0689$71808ec0$bf09d7d8@default>
Source record: 66691
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.swap

Hello,
I need one Collins 51J-4 mechanical filter for parts to fix my 1.4kHz filter...it has an open coil. If you have one laying around with at least one good coil (should be about 20 Ohms DC), I'll be glad to pay shipping costs. I think I can use any of the 51J-4 bandwidths to repair mine as they all have the same DC resistance and presumably the same coil bobbin.
Thanks & 73
Bob

> frequency of the modulating signal e.g. 100 Hz, or 50 to 1).

MI is equal to DEVIATION (not bandwidth)/ highest audio
freq used in modulation.....so the typical MI of NBFM
is 5/3 or 1.666...still more than Pi/2 though.

Simple question: I picked up an Acopian power supply surplus (it was on a burned out piece of seismographic equipment) From the catalog it would appear to be 0 - 60V, 250ma. The "+ output" is connected to the "+ sense" via a jumper, there are "- output" and a "- sense" terminal also. I guess that the "- sense" should feed an error signal back to the supply. How? Jack

I remember a simple 1 or 2 CK722 home brew SW Rx circuit in a copy of a
US Scouting magazine my US pen-friend sent me in the early '60s, the
local radio shop (remember radio shops ??) wasn't much help when I took
it in - but we were out in the sticks (even by UK standards) in those
days. If anyone has that circuit in their archives I wouldn't mind a
copy for old times sakes - I think the magazine was American Scouting or
something like that.
Sorry if this has got a bit out of thread.

Sense terminals are used to compensate for wire distribution loss.

You can just tie them to the appropriate (Polarity) outputs.

jhoyos@hoth.gcn.ou.edu writes:

>For digital instruments, what's 3/4 of digit?

A somewhat ambiguous convention for naming.

If you have an instrument that can read 000-999, that's pretty clearly
3 digits. If it will read up to 9999, that's 4 digits. But what
do you call something that reads 0-1999?

I would call that 3.3 digits (log10(2000)) but someone somewhere
decided to call a 2000-count range "3 1/2 digits" instead.

But what if you have a device that reads from zero to 3000? 3200?
4000? 4400? You need another number, larger than 3 1/2, but smaller
than 4, to describe meters that have more than 2000 but less than 10000
possible readings, so someone uses 3 3/4. But which of these does
3 3/4 actually mean?

It becomes silly pretty fast.

Dave

Well, Dana, sometimes it's nice to be wrong. Check out the "FreqMite"
Morse Frequency Counter by Dave Benson, NN1G for just $20:

http://www.smallwonderlabs.com/

I've built two so far and they are wonderful. I put one in every
homebrew project I build. The resolution is 1 KHz and the accuracy is
only +/- 1.5 KHz, but it will measure to 20 MHz and it's quality/price
quotient is just right. It serves my needs just great!

73,
monty

Doesn't 3/4 mean the first digit can be 0, 1, or 2? (but not 3-9)

Hi,

Electric Radio issue 99 has a nice article on what you seek. The mod
uses a 6BE6 as a combined BFO and product detectro. This could be
easily adapted to your radio. If you don't want to use a minature
tube, an equivalent full size tube could be used. My SP600 had been
modified that way and works quite well on SSB.

Bob

TO: Paul Keinanen, AC6V, Doug Smith and alforo.

Many thanks for your detailed responses to my enquiry.

Also the background references. Including sound reduction and the effect of various levels of 'noise' on humans.

Made me realise once again that although I had been using 'dbs' for years as measurement of circuit/radio path loss etc. it' s all based on the threshold of hearing and the logarithmic perception of the human ear.

Again, thanks to each of you. When things slow down this weekend I'll be studying the information some more.

Best Regards. Terry Sanford.

Dear Art,

Try this page http://www.oatleyelectronics.com/componts.html
where you'll find ZN414 or MK484 for US$ 2.50.
ZN414Z and ZN416E, both from GEC-Plessey, can be found with Partminer at
http://www.partminerclient.com for US$ 1.70 and US$ 3.00 respectively.
From there you can download Partminer version 3.0, a software that will
help you to find your components.

Greetings,

Luiz - PY1LL

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
Suggestion: Use a transformer with several 'one to one' ratio windings
to couple the speaker outputs and ensure that the output circuits of
each equipment do not have any DC connection, only audio.
You never know, even if one equipment was switched off that if the
speaker circuits were connected directly together, DC could feed back
from some other equipment and damage the output of the the switched off
equipment.
Also some speaker output circuits might/might not be connected to the
chassis potential of vehicle etc. so direct connection of out put
circuits could be 'potentially' (pun intended!) damaging.
You are only dealing with 'voice' frequencies (300 to 3000 hertz etc.),
so the transformer could be fairly low quality. Even one designed for 60
hertz would prob. be OK to isolate voice frequencies.
Might be easier to use a seperate speaker?
BTW please let us know what you eventually decide is your best
solution.
Regards.

Why Aluminum? One advantage of using a 'baking tin' is that with a
little bit of heat heat you can solder directly to the 'tin' (tinned
steel) chassis. Can be used for electrical connections or to fasten
things down!
Just an idea.

3063. FS: QST Back Issues $1.00 each

Newsgroup: rec.radio.amateur.homebrew

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have remaining:

QST

[1992 through 1998 issues are $1.00 each - 1999 issues are $2.50 each]

1992 Jan Feb Mar April
1993 Jan Feb Apr May June July Aug Sept Oct Nov Dec
1994 Jan Feb Mar Apr May June July Aug Sept Oct Dec
1995 Jan - Dec
1996 Jan - Dec
1997 Jan - Dec
1998 Jan - Dec (May issue is missing page 73)
1999 Jan Feb Mar Apr May June July Sept Oct $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45

>regulator and had no problems with the voltage changing.
>

have tried almost a douzen applications using 723, never experienced
any problems before, only the last two items drifts, perhaps it is
just the production series which is not good, or the ic is too old?

Hooked up a high quality OPAMP MC1741 working as constant current
supply with 5.1V ZD (3mA zener current) - 24VDC supply, and output
stayed within 10mV of 8.14V, while 723's reference voltage drifted
from 7.2-7.9V in the same period of time - without any more load on
the IC than 1mA

What do you mean by video pre-emphasis? In video transmission NTSC; whether cable or over the air broadcast, there
is no video pre-emphasis as far as amplitude is concerned. There is however at the transmission site, a group delay
compensation call a luminance to chrominance dealy pre-distortion network that will compensate for the group delay
error in the TV receiver due to the sound trap. Regards

Hey Gang!

I'm looking for a practical balanced-modulator (tube-type) for a 7 MHz direct-conversion receiver I want to build with vacuum tubes (now, don't ask "why tubes", I just wanna... and don't know why). I figure with a balanced modulator at the front end, I can keep the BFO energy out of the antenna, and maybe even get a few db gain. Maybe a dual triode? two?

thanks,
monty N5FC

I've got a product detector design that uses an NE602 chip. The transformer
that you need is a Toko RMC 502-182. The Digi-Key part# is TK1305-ND.
Unfortunately, I don't have a scanner; otherwise, I would be able to send
the schematic file to you as a gif. I am not sure where you are located,
but e-mail me if you would like to pursue this option. I have been using
this design in my own radios for the last 3 years, and it works great!

It is important to bear in mind that a circuit which is good for one
receiver is bad for another, BC342 and BC348 are dissimilar in this
way, for some receivers a heptode (6SA7, 6BE6, 6BA7) will work, while
others require triode-hexode/heptode like 6K8 or ECH81/6AJ8, I have
drawn a suggested circuit (gif format) for AR88 which requires the
latter solution, a similiar circuit is planned to be tested in
SP-210/BC-779 using ECH35 or 6K8

it is two possibilities of which I prefer the first:
1. You replace the octal based tube with plug-in octal plug mounted
with a noval type socket with and extra components for minimum
rewiring under chassis

2. You change wiring inside the receiver, but it is more work to
restore it later.

My understanding is that the second number refers to the base of the
digit, the first refers to the maximum value it displays. Therefore,
a digit referred to as 3/4 has a maximum value of 3 and rolls over
when it reaches 4. 1/2 has a maximum value of 1 and rolls over at 2.
Using the same logic, our base ten digits would be 9/10.

Hello--
Actually, after I "discovered" that the CK722 had an even smaller
transistor inside, I attempted to reuse one that had a lead broken off
at the case... alas, my 100-watt soldering iron fried the inner
critter<g>.

Speaking of devices inside of devices, I saw a photo of a Darlington
power transistor that had a TO-46 transistor mounted inside the
larger device's case. The TO-46's base went to the base terminal,
and the TO-46's emitter lead was bonded to the power-transistor die.

866s at least once in a lifetime! How true, how true! My first observation of the inner feelings one gets was on Dec 8, 1941. I was a kid, and a teacher by the name of Wheeler, and also a ham, was talking to Pearl Harbor in the aftermath. The blinking eerie blue glow accompanied by a faint mechanical click from the straight key and the throb (thump?) of the swinging choke ended my naivety as a child. Those blinking thumps from the screened box under the table are as clear in my memory as if it was an hour ago. Wow! Communicating across the Pacific! Imagine!
My most powerful rig sizzled with a pair of 816s supplying push-pull 211s in a rig made from BC375 parts. My Mom's clothes line had fire on the ends, when key down on 40!
Thanks again for the tech data and the inspiration. Not many can talk real "Ham" talk these days!

A very nice tube for doing this is the classical 7360 (RCA,Philips,...).
There is a Swan Newsletter issue (1990, I think) that shows how to
replace this rather expensive tube in Swan radios by a cheap 6JH8. These
can be found at http://www.vacuumtubes.net/price3.html for US$ 34.00 and
US$ 7.00.
But, for sure, any double triode or pentode can do the job perfectly and
you will find the circuits in old Radioamateur Handbooks.

Does anyone know the formulas for design a toroid transformer
for main supply (50 Hz) ie. how can I calculate number of coils per
volt for primar and secundar coils and the diameter of wire for defined
current (power consumption). I have a toroid core (an old transformer)
with specified dimensions, and I want to know how many power consumption
can I achieve, and how to calculate number of coils per volt and
dimensions of wire for specified current.
Please post an answer to my e-mail: abicz@sombor.net
Thank you very much for any answer !!!

In article <37E837A7.6913FCFC@sos.net>, Lynn Coffelt <lynnc@sos.net> writes:

>Wow! Thanks, Jim! Exactly what I wanted.

You're welcome!

>I think I have the parts for
>the style rectifier(s) and filter you mentioned.

If not, let me know. You gotta have a rig that uses mercury vapor rectifiers at least once in your life! I've got a little experience (20 years) with 866As.

>And I assume with a
>small bleeder load that would net almost 750watts ICAS.

Yep - but you have to be careful about the bleeder. For a choke input filter to work properly, the bleeder must draw enough current so that the input choke has enough inductance (critical inductance) to give proper operation.

For critical inductance in a 60 Hz system using a full wave rectifier, the input choke must have at least as many henries as "key-up" load resistance in kilohms. For a 2500 volt supply and an input choke of 25 henries, the bleeder resistance should be 25,000 ohms - which works out to 100 mA of bleeder current, and 250 watts of dissipation! You can use less, but the regulation will suffer, and the rectifiers will have to work harder.

The bleeder problem can be partially solved by using the idle current of the tubes as part of the bleeder. You can connect several chokes in series to get more inductance, too. Swinging chokes are designed for exactly this kind of service.

> As a class C
>final on CW, it could probably handle a single 813 key down for a minute
>at a time, but don't you think it could handle a pair of 813s in AB1 in
>SSB linear service?

In Class C, it will easily handle a single 813 forever - one tube is good for 450 watts or so in Class C.

In Class AB1, grounded cathode, (grid driven) the books say a single 813 with 2500 volts on the plate, 750 volts on the screen, and -95 volts on the grid will idle at 25 mA and peak at 145 mA. A pair will idle at 50 mA and peak at 290 mA, so this transformer should do a good job if the input choke is big enough.

Here's a possible design:

To power a pair of 813s in grounded cathode AB1 at 2500 volts, use a pair of 866As and a single section choke input filter. The choke is 40 henries (at 60 mA - it can "swing" to a much lower value at higher currents). The filter capacitor is 10 uF or more. The bleeder resistor is 200,000 ohms at 50 watts or so (the bleeder should be very conservatively rated). A separate 750 volt supply is needed for the screens.

At idle, the tubes draw a total of 50 mA, and the bleeder resistor draws 12.5 mA. At peak, the tubes draw 290 mA and the bleeder still draws 12.5 mA. That's 750 watts of input, and the book says 490 watts output under those conditions. In practice, 475 or so is more realistic, because of losses. That's more than an S unit improvement over a 100 watt rig. The grid driven circuit requirs very little drive power, of course.

The plate and screen voltages should be turned off during receive periods, both to reduce hash noise and to save power and heat. There should be an interlock system to prevent turning on screen voltage until plate voltage is applied, and to prevent turning on the plate voltage until the rectifiers have had time to heat up. Such circuits are not hard to design - I can supply, if needed.

Grounded grid operation is similar, and no screen supply is needed. The info I have says GG operation at 2000 to 2250 plate volts should give 40 mA idle current and 400 mA peak plate current. This may work, given the low duty cycle of SSB.

In the old days, it was common to push the ratings of tubes and components, 'specially if they were cheap surplus, and replacements were easily available. Today, it's usually more prudent to go easy on parts that may be irreplaceable.

> Again, thanks for the help. It has been bugging me
>for weeks!

You're quite welcome. Old catalogs are often priceless for this sort of stuff.

>
> thanks,
> monty N5FC

While I think the name might have come with solid state devices, the first reference to the term "direct conversion" that I can think of was Hayward and Bingham's article in QST for November 1968, "Direct Conversion -- A Neglected Technique", there is nothing new about direct conversion receivers.

One could argue that the regen receiver oscillating for CW reception is the basic principle, and I think there were direct conversion receivers made with tubes years ago, though I"m too tired at the moment to track down references. Homodyne comes to mind, and there was a synchronized variant, the synchrodyne, for AM with carrier reception.

Most definitely, there was a tube direct conversion receiver in QST for May 1961. I believe it gets mentioned in the Hayward article, with a comment that the concept had been around for a long time but hadn't seen much practical use in some time.

While it's probably smartest to use a balanced mixer for direct conversion, there were plenty of articles published in the early days after the 1968 article where all kinds of mixers were used. Anything that would work as a mixer was used to make the conversion from RF to audio.

The same thing happened with tubes, though they weren't called mixers. Instead, they were called product detectors. You'd see plenty of single triode unblanced mixers used, along with a lot of 6BE6s.

My point being that just about anything that was used for product detectors, or balanced modulators (where you are more likely to see a good selection of balanced mixers) in the days of tubes has potential for a direct conversion receiver.

Of course, some probably are better than others, for the same reasons that some solid state mixers work better.

I don't have the 1961 article handy, but one book I have mentions it and says it used 2 6SB7Ys in the in the balanced product detector, with 2 6SA7s also said to work well.

There was a time when the 7360 beam deflection tube was considered the ultimate in balanced mixer/modulator/product detector use. I'm not sure that you'd stumble on such tubes. At this late a date it might be smarter to use a more commonly available tube.

Look in any tube era book, and you're bound to find plenty of balanced modulators and balanced mixers and balanced product detectors.

You may be entering new territory, begging the testing of various circuits, for the very reason that there's been very little written up about tube type direct conversion receivers.

I need help in camouflaging or otherwise hiding my antennas. Any tips on how to disguise antennas? Have info on how to build disguised antennas? I already have done a lot with loading rain gutters, et al, with tuners, so don't need to go in that direction. Looking more for true antennas that can be hidden or disguised. I appreciate any hints you can provide.

Thanks very much for your help.

> to disguise antennas

Why not be patriotic and fly the flag? You can make a decent HF vertical
with a nice tall flag pole and lots of ground radials. Just take a basic
textbook design and modify for use of pole.
Hardest part is insulating base to be fed from tuning network. Perhaps you
can ground bottom end and feed to a tap several feet up.
If you live in an apartment, the same thing can be done with a large flag
staff off your balcony. This will probably only be decent for 10 or 15 mtrs.
In both cases, watch for hardware rectification that can cause severe TVI.
Bond everything as best you can.

Hallo,

I have an old Lafayette HA-250A linear amplifier, it is an small desktop model with 2 pieces of 6JS6C tubes in it. I do not have any information of it, I do have the following questions:

1) For what frequency is this linear designed?
2) What is the output power? looking at the tubes I expect 2 x 50 = 100 watt
3) What is the input voltage? (12V ??)
4) What is the pinning of the 8 pens input-socket?

If you do have some information please drop me a message.

73, de Peter (PA5KE)

3105. How Hot Is Your Coax ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-28 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <7sr5n9mfe1@neptunium.btinternet.com>
Source record: 66655

NOW AVAILABLE, NEW PROGRAM "COAXRATE.exe"

POWER RATING OF SOLID-POLYETHYLENE-INSULATED COAXIAL CABLES

The principal purpose of this program is to compute the temperature of inner and outer conductors and the jacket surface temperature for given RF input power, standing wave ratio and ambient temperature. Three different environments are covered - the cable in a draught-free close-confining duct, in still air on a bench or along a wall, or outdoors in a moderate breeze. From a few hundred kHz up to GHz.

From its dimensions the impedance and attenuation characteristics of an unknown length of cable may be found. If impedance is already known then a check on other data entries is available. Attenuation can be determined on a short length much more accurately than it can be measured directly.

INPUT DATA: Diameters of inner and outer conductors, jacket thickness, frequency, SWR, power input, ambient temperature and environment.

OUTPUT DATA: length of 1/4-wavelength, max possible SWR, nominal impedance, attenuation dB/100 feet and per metre, max amps, max volts, maximum power loss in watts per metre at a current loop, inner, outer and jacket temperatures in degrees Celsius, and the greatest voltage stress occurring at a voltage loop.

The dimensions of four common RG types of coax may be entered in the program by hitting a key.

By the way, the hottest place on a line is NOT where the SWR is at a maximum.

Program COAXRATE may be downloaded in a few seconds from my website. Not zipped-up. Can be run mmediately. (It can be run even without downloading.) Both educational and useful.

Hi there.
I am need of a few 1210 size surface mount inductors:

2 pcs 33 uH
2 pcs 39 uH

I can't find 'em locally and the mail order houses like Digikey
want $8 handling plus $6.50 minimum order surcharge to order
these $1 parts.

Anyone ?
Please reply by e-mail
Thanks de Hugh VA3TO

3107. BTX-121 Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-28 00:00:00 UTC
From: headshope@aol.com
Message-ID: <19990928171804.16456.00001945@ng-fu1.aol.com>
Source record: 66657

Question: BTX-121 2 Channel Radio

Calling anyone familiar with this radio...

Anyone aware of any modifications available for the BTX-121 from Radio Shack.

This is a 2 channel, crystal controlled radio in the business band and preset to 154.600 MHz for channel 1 and channel 2 crystal slot clear.

What I am seeking is any tinkering experience anyone may have whatsoever in playing with the radio.

Any modifications that would enable tx/rx outside preset frequency ranges with conforming crystal installed, internal squelch controls, band modifications, power mods, dtmf or the like are sought.

Any adjustments available for this radio?

Understanding the general nature of this request, I am just seeking any mod or adjustments anyone may have experience with this rig.

These radios are on clearance for around $49.00, quite a mark down from the original prices, looks as though they are moving up. This may be a good opportunity to pick up a few.

Thanks for any reply,

Bill.

3112. UPS to PS?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-28 00:00:00 UTC
From: Michael Ruzinsky <maruzin@earthlink.net>
Message-ID: <7srrcu$n0b$1@holly.prod.itd.earthlink.net>
Source record: 66662

Can uninterrupted power supplies (UPS) be used to power high current rigs?

About a week ago I came across an APC 650VA smart ups rated at 410 watts output. I am in need of a power supple to power my HF rig (20A max. 16A cont.) and it occurred to me that I might be able to use the ups. The internal power supply has a 13.8V output to an 11 Ah battery. The positive lead to the battery is fused with a 40A 32V fuse. Other than that I am not sure how to proceed.

Does the very nature of an UPS prohibit me from simply connecting my rig to the ups 13.8V leads? I mean, does the ups only supply a small charging current to the battery when you have AC power available and then allow you to draw high current from the battery when the AC goes out?

Michael Ruzinsky

That's pretty much true.

If the battery is rated at 11 Ah, the *maximum* safe charge rate is
probably about 2.5 A. That's a characteristic of lead-acid batteries.
So the UPS internal charger is probably capable of no more than this.
Quite possibly it's only capable of 1 A or so, since UPSes don't
expect to be triggered very often and a slow charge (overnight or
even 24 hours) is considered OK.

Now, the battery *will* supply the 20 amps you need for short periods,
just not for long. If you intend to use the rig for receive almost
all the time, only transmitting in short bursts, and if the current
drawn by the receiver during receive is less than what the UPS charger
puts out, you could get away with powering the receiver from the
battery. The UPS will slowly charge the battery most of the time,
with the battery supplying the bulk of the current during transmit.

But really, this isn't a very good system. You'd be better off
getting an AC-powered supply rated for 20 A or more out, which would
allow you to transmit for as long as you want.

Dave

3114. Need free webspace for Ham/SWL/Scanner Page?

Want to have a Ham radio or SWL Web Page, for free? Without floating
ads and other popup banner windows, etc.?

I am offering free web space for Shortwave, Scanner, and Ham Radio hobbiests.
Please come and visit http://hfradio.org - there is a link to the sign-up
page. There are a few already active with their sites, which you can also
see from the listing page.

There is a lot of other things at the site, as well. But if you are looking
for a great place to mirror your site, or to have your main site, consider
http://hfradio.org.

73!

(10 meters is starting to show signs of activity. You can find me there often)

Two more things to consider:

First, the battery ground may or may not be an
electrical ground. This would be a bad thing.

Second, although the battery could output the 11A OK, the charger may not be designed to run properly when the battery is being discharged at this rate. (At power fail conditions, the charger is off) Seems to me you could blow the charger.

Source record: 66668

I took the battery out of my APC 420 and built spade power cables to run my radio. I get 5 or six qso's out of it. My radio manual says max draw is 20.5, but a 20 amp fuse has been working for over a year. My cw qso's are rarely at hi power though. I should hook an ammeter up and see what it really draws. I own an 11 amp switching astron, and don't want to buy a 25 amp, so I am interested in using a sealed lead acid in parrallel with my power supply. I may need to switch off my power supply with the relay line to protect it. Could you switch off the ups's charger with your relay line? Good luck, and careful or you might learn something.

I have found out that db is one of those
apples and oranges type of things, because
the term is used in two related fields:
1) acoustics
2) electronics

A good reference on electronics is: "Reference
Data for Radio Engineers" by ITT pub. by Howard
Sams. I have 6th ed, but ther maybe later ones
out.

My reference on acoustics is "Acoustics" which is
one of the Schaum's Outline Series in Engineering
by McGraw-Hill

But in all fields it is the log (or ln if it is Nepers)
of a ratio. The confusion is what is the basis, that is
why I think db should not be used by itself. One should use
dbm, dbu, dba0, dbr, etc.

You don't have to use a relay, just use a big 12v
incandescent bulb. It'll act as a cheap
non-linear resistor, limiting the peak current
from the supply.

23 rd MID-ATLANTIC STATES VHF CONFERENCE
Saturday, October 2, 1999

Hampton Inn
1500 Easton Road (Rte. 611)
Willow Grove, PA

Hotel Reservations 215-659-3535 or 800-426-7866*
Rates are $89 to $99 + 8% tax
Conference Admission: $24

Free Admission to Hamarama Flea Market with Conference Ticket on Sunday
Oct. 3

Hospitality Suite at Hotel Friday and Saturday Night at 7 PM

Lunch and Conference Dinner Saturday at the Hotel

Door Prizes at the Conference Dinner

You don't want to miss the 1999 Pack Rat sponsored 23rd Mid Atlantic
States VHF Conference . It's packed with lots of great technical
presentations.

We look forward to seeing everyone on Saturday Oct. 2rd. Registration
is
at 0800 and the conference starts at 0900 on Saturday.

The Hospitality suite will be open Friday (7 PM) and Saturday Night.

Free Ticket to the Hamarama Hamfest the following day, Sunday October
3rd. See the Packrats web page at
http://www.ij.net/packrats/HAMARAMA.HTM
for a map to Hamarama just off of Rt. 232 Middleton Grange Fairgrounds
in
Wrightstown, PA north of Newtown.

See the Pack Rat Web page for additional information:
http://www.ij.net/packrats

Conference Speaker List:
Frank Potts, NC1I - 432 EME/Limited Multi-Op Effort

Matthew Reilly, KB1VC - Line-of-Sight Plot Server

Brian Justin, WA1ZMS, Douglas A. Sharp, K2AD, Gordon Howell, WA4RTS -
1st 75 GHz VUCC

Buzz Miklos, WA4GPM - 6 Meter Power using a 4CX1500B

Paul Drexler, W2PED/John Sortor, KB3XG - 1 Watt, 24 GHz Power Amp

David Meier, N4MW - Microwave Activity from FM17

Brian Skutt, ND3F - A Unique Rover Operation

Peter Anderson, KC1HR - A Direct Digital Conversion Receiver

Al Katz, K2UYH/Tom Dinyovszky, KB2AH - 60 Foot EME Dish Project

An afternoon technical session will be held from 2pm to 6pm. It will not be a Noise Figure contest. This session allows hands on data taking, tweaking, and optimization consultants will be on hand to troubleshoot dead equipment. We will have same compliment of HP equipment as last year
consisting of a HP network analyzer to 6 GHz, HP Noise Figure meter to 18
GHz, HP Spectrum Analyzer to 22 GHz, Power Meters, Power Supplies, coax adapters, spare GaAs fets, and soldering equipment.

For further information, contact Conference Chairman, John Sortor, KB3XG
at 610-584-2489, 610-613-9360 or e-mail at JohnKB3XG@aol.com.

* Local number preferred for the Hampton Inn. Other local hotels can be found at http://www.bccvb.org/hotels.html or use the link on the packrat web
page.

Visit the Mt. Airy VHF Radio Club at:

I have got hold of a 3W mobile phone booster amplifier and would like to use it as a PA block in my hombrew 1.2Ghz txmitter.

The phone booster is and NEC A5M3W-32 and uses a PF0032A output device. It is designed for use with the NEC MP5B2A mobile phone hands free kit.

If anyone has ANY information on the above (pin-outs, wiring diagrams etc...) could they please reply.

Cheers
Jon

South Normanton & District Amateur Radio Club are holding a Radio &
Electronics Equipment Mini-Fair at the New Street Community Centre,
South Normanton, near Alfreton, Derbyshire, (England) on Monday 15th
November 1999. Starts 6.00pm, everyone welcome, refreshments available.
Easy access from M1 J28 and A38.
QRP kits, radio equipment and component traders in attendance. Tables
are available for booking, but are going like hot cakes.These are
available on a first-come, first-served basis, so don't be disappointed,
please book early!
For further information, and to book tables, please call Russell Bradley
G0OKD on 01773 863892, or e-mail Duncan Walters G4DFV on tesla@cwcom.net

3127. Current ratio through parallel resistances

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-29 00:00:00 UTC

Message-ID: <37f28c20.23547872@news.earthlink.net>
Source record: 66677

I think there's a relatively simple equation that gives the current
ratio through two resistors in parallel, given the resistance values.
For example, 80% of the total current would flow through one resistor
and 20% through the other resistor. I tried deriving an equation, but
the math quickly got out of hand. Any ideas?

3130. Re: Current ratio through parallel resistances

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-09-29 00:00:00 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <lbyl3.26835$d71.784220@news4.giganews.com>
Source record: 66680

The voltage is the same across both resistors. The total current is the sum of the two currents. The current through each resistor is inversely proportional to its resistance.

So the currents are E/R1 and E/R2. 1/R1 and 1/R2. The ratio of the currents is R2/R1 = I1/I2. The sum of the currents is I1+I2. The total resistance is !/((1/R1)+(1/R2)).

Calculate the total resistance and the current is shared in inverse proportion to the individual resistances.

3131. Re: Current ratio through parallel resistances

Newsgroup: rec.radio.amateur.homebrew

Message-ID: <37F2F8FB.49D67933@teleport.com>
Source record: 66681

I believe the formulas others have given are correct. But what you're looking for might be:

For R1 and R2 in parallel, the fraction of the total current which flows through R1 is R2/(R1+R2) and through R2 is R1/(R1+R2).

Roy Lewallen, W7EL

>dbm, dbu, dba0, dbr, etc.
>

I'd think more often, dB would be expressed _without_ the reference. That's cause it is a pure ratio. But it depends on entirely what info you're trying to convey.

If your amplifier has 10 dB gain, it's 10 dB, period. Regardless of whether you want to put a microwatt or a milliwatt into the input.

On the other hand, if your expressing dB relative to a fixed reference, then you certainly have to say what the reference is, as in 10 dBm. In that case, use of dB is almost kind of superfluous. Saying 6 dBm is the same as saying 4 milliwatts.

Nick, Wa5BDU

7 dB older than 10.

Hello, I would like to welcome you to the new site, Cliffdwellers. A discussion of Antennas in restricted locations such as Apartment Buildings, Condos, Small Lots, and Stealth Antennas. I want to help amateur radio operators with the difficulties of operating from locations with less than desirable conditions. I myself have been a ham for the past 6 years and have operated from apartments all of that time. I always struggled building something that was hidden and functional. With Cliffdwellers I hope to be able to provide a resource for people to share their thoughts and ideas with others in need of finding a solution. Below is how to subscribe, unsubscribe, and list to the group.
Enjoy ! Greg Heath KB2QQM

Thanks for the answers. Looking at the info, I came up with the
following: Assume two resistors, R1 and R2. The current through R1 is
100xR2/(R1+R2) percent of the total current. It came from
100x(1/R1)x(R1xR2/(R1+R2)), and the R1's cancel out.

Hello,

Sorry to take so long to reply, but better late than never.

Two QST articles are "must reads" on this subject.

The first is the article by White in May, 1961. He built a direct conversion 80/40 receiver with five tubes: 6SK7 RF amp, two 6SB7 in the balanced detector, a 6U8 audio amp, and a 6C4 local oscillator. His reason for using a balanced detector was to eliminate any signal reception by direct rectification of the signal. (Note: The 6BA6 is essentially an improved miniature version of the 6SK7, and the 6BA7 is a miniature version of the 6SB7).

The second article is by DeMaw and Wilson and appeared in July, 1973. They describe a complete 80 meter QRP transceiver using tubes. The product detector is a single ended 6GX6 circuit. Apparently they had no trouble with direct signal rectification. This design should be easily adaptable to 40 meters.

Leakage of the LO signal into the antenna is not a major concern unless a detector circuit which has poor isolation is used. If an RF amplifier is used ahead of the detector, there is no reason to be concerned at all.

The most important concern is that the detector operate in true "product detector" fashion. What is meant is this: The only output from the detector should be the result of beating (heterodyning) between the received signals and the local oscillator. Direct signal rectification should not produce any output. The reason for this requirement is simple: It's not practical to have much RF selectivity in front of the detector. So if a detector which rectifies the signal is used, you'll hear dozens of signals at once.But if a true product detector is used, only signals which are within a few kHz of the LO frequency will produce audio output.

The White receiver, based on an article by Villard, achieves true product detection by means of a balanced circuit that causes rectification products to cancel out. Other product detectors avoid the problem by operating only on the linear region.

Other considerations are low noise, reasonable gain, and available parts.

Some have suggested using the balanced modulator circuits used in SSB transmitters. While the basic circuits may be adaptable, it must be remembered that a balanced modulator for an SSB transmitter is not designed with low noise figure in mind.

The 7360 tube was widely used in such circuits, but it can be expensive and hard to get. The 7360 was considered to be a transmitting tube, and was only made by RCA (I think). There are other beam deflection tubes, however, such as the 6ME8 and the 6JH8, which are often not recognized for what they really are. They were designed as demodulators in color TV sets, and are actually newer designs than the 7360. By the way, if anybody has practical data on the use of either tube as a receiver mixer, please let us know!

My recommendation would be to start with either the White circuit or the DeMaw/Wilson one, depending on what parts you have available.

You don't have to explain why you want to use tubes. Those who know why, don't need an explanation.

The positive >lead to the battery is fused with a 40A 32V fuse. Other than that I am not >sure how to proceed.

I seem to recall an article in either 73 or QST with a belief it was 73 that featured using the transformer in a UPS to get approximately 15 volts and filtering down to 13.8 volts or so at about 20 amps. If you can get the thing cheap enough and it really does have a transformer to go from 12 volts to 120, you might be able to duplicate the feat. Please note that you will have to use pass transistors, large capacitors and the like, and if I remember correctly, he also had to use the leads of the transformer secondary as the primary, in other words, it took some doing.

>line it will be useless.

The APC 650 UPS that he has is an off-line type. It uses a 60 Hz
inverter and step-up transformer to produce 120 V. The battery is
slow-charged, so the charger output current is low.

Anybody know of any chips out there that receive/decode WWVB time signals? I've heard that Raido Shack has a cheap receiver ($40?), does anyone know what they use? (Yeah, I could build one, but this is aimed at a product, so ready-made is really better here)

I would think that if you looked in old QSTs and ARRL handbooks you'd find plenty of information on the 7360. Squires wrote about it in QST in 1963, I've never seen that article but I gather it was sort of a designer's eye view of the Squires-Sanders receiver that came out around then, and then for the rest of the sixties the 7360 was seen as the ultimate for mixer purposes. The tube was all over the place.

Pat Hawker has had a column in the RSGB's magazine for what seems like forever. He goes through all the other amateur publications and professional magazines, and copies out interesting schematics and detail into the column. Since he's based in the UK, it often covers items that we don't see over here, and often covers the things we do see here in a somewhat different fashion. The column certainly saves people from each wading through all the magazines.

In truth, I've never seen the column. My comments are based on having a couple editions of his book that collected up the various bits from the column in book form. The most recent one I have is twenty years old, and it's still a good source of information. Sice he collects the important bits, it is a lot more condensed than a book that tries to cover everything by collecting full articles in one place, which the ARRL handbook often looks like.

I assumed that the RSGB stopped publishing the collections at some point, because I don't recall seeing anything in the North American (read US) amateur press about a new edition in an awful long time.

But in a recent QST that I bought, I see that the ARRL ia advertising RSGB publications, and among them is Pat Hawker's book. I assume it's a more recent edition (I don't have the ad handy), and while it perhaps is too recent to cover the 7360, it is a book well worth buying.

Unless the title has changed, it's "Amateur Radio Techniques" by Pat Hawker.

I just discovered that the remaining local place that sells anything remotely ham related carries the RSGB books, and I intend to splurge later this month and get the latest edition of Amateur Radio Techniques and a couple of other RSGB titles that looked neat. I'm rather excisted about getting them.

From: noone@nowhere.com
Message-ID: <37f4dcdd.143771844@news.squonk.net>
Source record: 66684

Way to think of it is this: In series, the ratio
of the voltage drop of one resistor to the total
resistance is that resistance over the total
resistance. The bigger the resistor, the higher
the percentage. This is a voltage divider.

In a parallel setup, it becomes a current divider
(as you know), and the *inverse* of the resistance
over the total of the inverse of all the resistors
gives the current ratio for the one resistor.

parallel current percentage =
(1/Ra)/(1/Rb+1/Rc+1/Rd...)

series voltage percentage =
Ra/(Rb+Rb+Rc...)

Source record: 66551

I have come across a Varian VA-152-B Klystron tube. The spec sheet enclosed with the tube states only "FO" in the frequency column. The tube itself has no waveguide flange, instead it has an elongated oval window like a waveguide with a metal tab in front of it. It appears the tube is a cartridge to be inserted in a waveguide. There are no tuning screws visible anywhere. Does anyone have any idea the operating frequency range of this tube? Does it require an external cavity?

Hello,

I am inviting you to come visit http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

To fill in some details:

Amateur Radio Techniques is based on material originally published in Pat Hawker's Technical Topics column in RadCom and its predecessors. The last edition was the 7th, hence the acronym ART7.

Since then, the RSGB have opted to collect and reprint the columns verbatim. They have published two such collections, Technical Topics Scrapbook 1985-89 and 1990-94. There is thus no overlap between any of the books.

They're fab. Buy them.

> So I decided to look further on his construction. There was no current
> limit, and few of the recommended guidelines had been followed.

I used the 723 regulator nearly 30 years ago when designing power
supplies
at Hewlett-Packard, and never had a problem with them. However, I quit
using 2N3055 power transistors before 1973 because they are dependable
but
not very impressive in higher currents.

If your 723 output voltage is drifting at low-level load, it might be a
bad regulator. The 723 is normally solid as a rock with little
temperature
drift.

However, the amount of output current the 723 can provide to drive a
series-pass
transistor is limited. 40 amps is a *LOT* of current, so you need a
current
gain of at least 400 in the pass transistor to carry that kind of load.
That
means you need a good power darlington transistor with an hfe of 1000 or
so
at the rated current if you expect good stability over a wide current
range,
with an appropriate base-to-emitter resistor to make sure you meet the
minimum load current needs of the 723 when the base of the darlington
device
might not be drawing enough at low output current.

It has been years since I looked at the device, so I don't recall
whether there
is or is not a minimum output current required.

Clarke Echols, P.E.

Hello,

There's lots of basic info about the 7360 in old QSTs and other ARRL publications, as well as in the RCA transmiting tube manual of the era. Trouble is, it's mostly info on using the tube in SSB transmitter applications, not as a high performance receiving mixer. The receiver applications of the 7360 described in the above publications are either for use as a single-ended mixer, or as a product detector. The info presented is good, but certain details are lacking, such as the optimum drive level for the deflector plates and the optimum plate load impedance.

The Squires article gives lots of good RX design philosophy, and some
circuits, but again lacks the detail needed. This is understandable -
one can hardly expect the authors to give away their unique and
advanced receiver design to the competition.

The tube WAS all over the place. There was even an article on a phasing-
type 6 meter SSB exciter using the 6JH8. But hard data on how to design
practical balanced receiver is hard to find on this side of the pond.

getting them.

Over the years I have collected (for very little money, actually) every QST from mid 1944 to the present, most of them back into the mid-20s, and most of the Handbooks and other ARRL publications. Also, "the Radiotron", lots of RCA tube manuals, and a smattering of other stuff - but no RSGB goodies. Invaluable info and history, but in certain very specialized areas the coverage is a bit thin.

Primary interest here is building a high performance CW transceiver around the few hundred pounds of hollow-state parts I have available. Current rig uses a 7360 receiving mixer in the classic single ended mixer configuration. Works, but IF rejection is lacking, compared to a balanced design. Have some 6JH8s and 6ME8s, too.

Thanks for the tips.

See my website (below) for some pointers on this. My guess is that
anything you salvage from a burglar alarm system is going to be hard to
modulate properly at 10 mbit/s, but lower speeds should certainly be
achievable.

I've two cavities working I guess in the 10 GHz band, recovered from an old home alarm system. I'd like to use them to set up a radio link between two computers. I knew somebody had already found the way to connect such cavities with Ethernet cards, but that subject is described on a magazine I haven't at hand. Has anyone already had any experience of that kind? At the beginning I thought I could use the RS232 line,
but I knew connecting to an Ethernet card is easier. I've been searching on the web for such a topic: so far no result. Any suggestion?

3165. Radio Amateur software for AMIGA ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-02 00:00:00 UTC
From: Geert Pirens <geert.pirens@ping.be>
Message-ID: <7t3emvklq2@news3.Belgium.EU.net>
Source record: 66565
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,tw.bbs.rec.radio.amateur,uk.radio.amateur

Hello,

I like to make a list about all available AMIGA software that is useble for
radio amateur purposes.
So if you now some name, a link on the net, a address where to buy or other?
Please let me now by mailing me.

I'll make the list vieweble for everyone at my homepage.

All information is welcome!

Thanks in advance.

Geert - ON1DQD

Pat's column is indeed excellent, the first thing I read when my RadComm arrives. There are plenty of other excellent technical articles elsewhere in there too. I think you can still sign up for RSGB membership through the ARRL, using US $. (I keep renewing with my credit card so it becomes a non-issue..) It's well worth it. The proportion of useful information in a copy of RadComm far exceeds that in a copy of QST. (and I consider contest results "useful information"..)

Amazingly, Pat also finds time to get on the air; I've worked him at least three times...

I would love to see a circuit diagram somewhere once you get it done.. Not that I have the time to actually use the info, but it'd sure be interesting to look at.

3167. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7t4750$n41$1@news.hawaii.edu>
Source record: 66567
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Er, Halfords? They do a whole range. Other than that any car radio
shop. They should be standard DIN connectors on a Blaupunkt.

Then you probably have the RCA Transmitting Tube Manual - Technical Series TT5.
You will find technical data on the 7360 on page 224 - 229 (If I remember
correctly..) If you don't have this manual, you can buy it from me if you want
- or, shit, I can just take a copy of those pages and send you by mail.

Best regards,

3170. WTB: Small Bud (or similar) Cabinet

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-02 00:00:00 UTC
From: "Cestyll O. Dywod" <willi6@erols.com>
Message-ID: <37F61849.5B2B@erols.com>
Source record: 66570

I'm looking for some small cabinets for nostalgia Home Brew Projects. Something along the line of a Bud Model C-993 or equivalent would be great. That one measures 10" Wide, 7" High, and 6" Deep. I can work with something a little larger or a tad smaller. Not too pickie! Has a trap door on the top, louvers on the side, detachable front panel, and with or without a matching chassis.

I'd prefer an unused one, but could work with something with limited previous holes (e.g., I could make a new front panel). Any classic finish (black, grey, wrinkle, hammertone) would be fine.

Drop me an e-mail if you have something in this line.

Thanks!

73, Dave K7HMP

The De9 plug is the interface to the radio.
Pin1 is tx audio to your radio
Pin 3 is PTT for the radio
Pin 5 is receive audio from the radio.
Pin 6 is ground to the radio

The round coaxial plug uses anything from 6V or so above. Common is
12V.

The DB25 female jack is the same as an external modem. I use a
external modem cable to conenct to the KPC3.

If using comm 1, which on my PC is a DE9, then a external modem cable
is in order. If you need pin outs, let me know and I'll send them.

If using comm 2 , which on my PC is a DB25, then the external modem
cable is a db25 to db 25 "straight thru" cable, where pin 1 goes to
pin 1, pin 2 to 2 etc.

Oh yes, got that. It was all in a QST article in the early '60s, too.

Trouble is, it's all about using the 7360 in TRANSMITTING applications, like balanced modulators and transmitting mixers where considerations like noise figure and wide dynamic range are of little concern. As a RECEIVING mixer, there is precious little that I have been able to dig up - the Squires article, the various single-ended designs in the Handbook and QST, and two QST articles in the early '70s. None of them gives "how-to" design info, which is what I'm looking for.

Tim, after all these years that have gone by, and all the pl259s I have put on, I found the best way to ensure a leak free joint is to use a good old 1 pound propane bottle with a torch head attached. Up here we call them burnzomatics, I am sure in your neck of the woods you call them by another name. You can reduce that flame to just the right amount to get the right heat.
Good luck, Les

>Imagine!

Man oh man, what a story! How soon after that was it all shut down "for the duration"?

My first experience with MV rectifiers was when I built a new rig in 1979 that used a pair of 807s in the final. I'd picked up some nice iron and tubes for pennies at a local hamfest, so haywired together a supply just to see what it could do. Have built several rigs since then - all with 866As for the HV. Sure, it's overkill for a pair of 807s, but after 20 years I have only managed to wear out two tubes. The light show amazes and astounds both ham and nonham visitors. The six VR tubes of various colors also help.

> My most powerful rig sizzled with a pair of 816s supplying
>push-pull 211s in a rig made from BC375 parts. My Mom's clothes line had
>fire on the ends, when key down on 40!

Oh yeah!! Never could find decent 816s, though. 866As were cheap and plentiful until a few years ago, though, when "that old tube stuff" became "classic" and "boatanchor".

> Thanks again for the tech data and the inspiration.

If you need any parts, just let me know. I've got some nice UTC swinging chokes that can do the job. Put two of them in series and have fifty henries with the key up. Plus plenty of stuff from BC-375 TUs...

Since 1979, the main rigs here have been a succession of 150 watt homebrew hollowstate bandswitching CW transceivers made from "recycled" parts. ("Recycled" is more "electro-politically correct" than "junk"). From 1987 to 1995, these rigs were used on FD as well as at home, usually in Class 1B-1 or 1B-2. The flash of the rectifiers in the tent help keep one going at 3 AM!

In 1995, running this rig in a totally solo operation, I made 629 QSOs using just an inverted V and a homebrew vertical. Rained all weekend, too. Quite an experience!

>Not many can
>talk real "Ham" talk these days!

Just get me started and stand back!

The past few years I've gone out on FD with a local club, because family obligations prevented doing a solo operation. In FD, you could earn a bonus by copying a message from W1AW that was first sent at 10 AM on Saturday - usually before anybody had a working setup. So I showed up with a dynamotor-powered Command set receiver/converter setup, tossed a few feet of wire into a nearby tree, hooked into my car battery and made the first 100 points for the club. The expressions of the onlookers were priceless.

Now if I can just find some potash and enough jelly jars, perhaps I can give slopjar rectifiers a try.

VF for PVC insulated wire with insulation thickness about same as wire diameter is about 0.985

The velocity is reduced more when the wire gets nearer to the ground than by its insulation.

For any real difference from bare wire the insulation would have to be inches thick.

If you intend to use insulated wire as a protection against acid rain I suggest enamelled copper wire - the stuff which is used to wind and repair small 60Hz power transformers and electric motors. I have never used anything else.

It is no heavier than bare wire - which is of importance in antenna construction.

Thanks! That helps quite a bit.

I didn't think of using enameled wire, the PVC
stuff was what I had lying around.

3192. bottling lagers - a question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-03 00:00:00 UTC
From: Dan <djnaab@students.wisc.edu>
Message-ID: <7t89n3$ts8$1@news.doit.wisc.edu>
Source record: 66592

I am considering trying to brew a lager beer in an extra dorm fridge we have lying around, but am curious about what the consensus is on the best way to bottle. Surprisingly, I can't find any information about it online.

Should I rerefridgerate immediately after bottling and let it carbonate and age at cool temperatures, or is it okay to complete this stage at room temperature? I'd imagine doing so at room temperature may impart some undesired flavors into the beer, but aren't experienced enough to know if it's noticable enough to worry about. Unfortunately, I don't have a lot of fridge space. Also, how long do most people lager? After bottled and carbonated, how long will a typical lager keep if stored at room temperature?

Thanks for your help!

3199. Q: Tube-Type Balanced Modulator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-03 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <37F78CE9.883E645B@tri.net>
Source record: 66599

Peter Chadwick who is a professional RE and frequent contributor to the RSGB pubs spoke at one of the Dayton seminars some (many?) years ago on receivers. I asked about the 7360 Squires type first mixer. Not wanting to misquote, but here goes: Some trouble with hum, some trouble with microphonics, he commented that performance didn't seem as great as indicated in the articles. You must remember that when Squires published his QST article (and I think died shortly after), there was not the big emphasis on measurements. Suspect that the existing tube gear was very adequate for the QRM levels then and selectivity was a bigger problem. Shift to solid state poorly done and better filters changed the emphasis.

7360s are scarce and expensive now. The 6JH8 is a ruggeder tube, was used in TV's also and seems more available from the tube guys at the hamfests.

There are a couple of major differences between the diode switching modulators, the cross coupled transistor mixers and the beam deflection mixers . With the switching mixers, unless the rise times of the switches are short and of adequate power, a strong signal can actually cross-modulate the OSC signal during the transition. Not much actually happens during the time on or off. The cross coupled mixers have the same problem. Also since these a basically switches, the unwanted products at the output have to either be terminated accurately, shorted (current, no voltage: no power), or open circuited (no current, some voltage: no power). Otherwise they kick back into the modulator and add to the problem. (I'm going to get flamed here.)

With the cross coupled mixers and nice clean sinusoidal LO, the same thing happens.

With a beam deflection mixer, the beam is amplified by the grid-screen circuit and probably doesn't even know that the deflectors and plates are there. The deflectors swing the beam back and forth across the plates with the beam not really caring where it goes. The signal probably has little effect on the deflection electrodes. (Although Squires made a comment on not saturating the deflectors as they "stick"). Also the LO is pretty well isolated from "pulling" of the LO as the mixer sig level changes. It would seem that termination of the plates MIGHT be of lessor importance than with diode mixers as IF signals well away from the desired IF will be grounded by the HI-Q tuned plate circuit--a big NO with the diode ones.

I've built a couple in the past, but made no measurements. In fact, my old SX101 MKIII got converted to one in the product detector way back, and seemed to work ok. "All Indians walk single file, the one I saw

did!"

The 6JH8 and 7360 have different operating voltage levels. As for NF, again haven't measured, but at HF, bet one hooked directly to the antenna thru some BP filtering will have an adequate NF for any practical situation.

Hope these random thoughts are useful.

> a big tip for soldering PL-259's
==========
Have you considered a butane gas powered soldering iron .
Heat output is adjustable to up to equivalent 60 Watts.
Size of the 'iron' is that of a board marker. Interchangeable tips
each have a catalytic burner.
Gas 'refill' is from a 'Ronson' cigarette lighter butane can.
Excellent for your PL-259 plug application, but also for low heat
input soldering jobs.

The make I use is Portasol (Ireland) ,but Weller and others also
manufacture them.

3202. TiCK keyer in TenTec QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-04 00:00:00 UTC
From: Doug Smith <w9wi@bellsouth.net>
Message-ID: <37F846B3.40C04B03@bellsouth.net>
Source record: 66602

I got my TiCK 4 keyer kit on Friday, and couldn't resist building it & hooking it up over the weekend.. (probably cost me about 100 QSOs in the Cal QSO Party, though the QRP rig seemed to be about as effective on 20CW as the 400-watt big rig...)

If anyone else is considering this combination.. here's how I did it.. It's only been tested with the 1320 20-meter radio, but I have every reason to believe it will also work in the other rigs of this line..

First, if you haven't built the Ten-Tec yet, I would recommend drilling the extra holes first. You'll need a 1/4" hole for the pushbutton switch used to access the TiCK menus. This is probably best put on the front of the radio -- I punched it 1" to the right of the headphone jack. You will also need a hole for the paddle jack. I used a 1/4" jack and drilled the hole just below and to the right of the Sevierville ZIP code - it obliterates the "862" part of 37862. The TiCK kit includes a 1/8" stereo jack, and that would be easier to deal with if you're willing to put a 1/8" plug on your paddles. Besides, if you use a 1/4" jack, the left-rear sheet-metal screw that holds the case in place is going to short to one of the contacts; you'll have to remove it..

Finally, you'll need a hole or two to hold the TiCK board in place. I drilled one hole about 1/4" to the left of the "M" in "MODEL 1320"; ran a #2 screw through this hole, and used a #2 nut on the other side to hold it in place. I then slipped the TiCK board over this screw and used a second nut to hold the board in place. The first nut served to hold the back side of the board away from the back panel of the radio. You should put some kind of insulating material between the foil side of the TiCK and the back of the TenTec case. I had some double-sided foam tape, and used it as insulation. If you haven't already built the 1320 (I had) it would be easy enough to drill another hole and use both mounting holes in the TiCK.

When building the TiCK, omit R2. I would probably omit C5 if I were to do it again too. These components serve to reduce the level of the sidetone signal fed to the rig. The sidetone level is too low as it is, you don't need to reduce it further! Wire the TiCK for 12-volt power - i.e., install U2, C1, and C2.

Of course, the paddle input (J1-1/2/3) goes to the paddle jack. J2-1, the 12-volt input, can be wired either to the switched side of the power switch or directly to the 12-volt power input. If you run your 1320 from an AC power supply or a fairly stout battery, the 12-volt power jack is probably the right place to go. This way, the TiCK won't lose its memories when you turn the rig off. I planned to operate mine from a less-than-stout battery, so I wired it to the switched side. Don't

forget to wire either J1-1, J2-2, J3-2, J5-2, and/or J6-2 to ground.

J3-1, the keyline, goes to the center of the KEY jack on the back panel. (I suppose you could remove the KEY jack and put a 3-circuit jack for the paddles here, but then you wouldn't have a way to temporarily connect a straight key -- or a computer interface for contesting) J4, the 5-volt input, should NOT be connected to anything; you're using the regulator circuit and J2 instead. J5 wires to the pushbutton switch. J6-1 I connected to the high side (the left side, as you look from the back of the radio) of the VOLUME control. This may not be the best place for it. There is just barely enough gain to hear the TiCK's sidetone -- which you need to navigate the menus. In fact, if the band is crowded I have to carefully tune to an open frequency before I can set up the keyer. Someday I will move this wire to the junction of R9, R10, and R11. (the input of the audio preamp/low pass filter) If you haven't built your TenTec yet, it may be a good idea to tack a length of hookup wire to this point. It's much easier to do during construction than after the rig is complete. (Oh, J7 doesn't go anywhere..)

The combination works great. It provides a handy little transceiver that can make plenty of fun CW QSOs all in one package.

3205. Tall Antenna Tales

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-04 00:00:00 UTC
From: bshort@speedchoice.com
Message-ID: <MPG.1262de00e435ba789897cc@news.speedchoice.com>
Source record: 66605

Tall Antenna Tales

A local ham friend (K7JAY) recently bought parts of
several antennas from a local horse trader (KI7ZZ).

The idea was to take parts of a Mosley PRO-95 and
PRO-67 and make a PRO-96 and a PRO-57 (which
was sold to W7HSP).

So, now 2 local hams have parts of 2 antennas each.

Next, I (K7ON) got recruited to help install the PRO-96
at my antenna farm after reading a comparison report
by N0AX.

K7JAY went with me to the desert one Saturday morning
to assemble the PRO-96, but it has now been about 5 or
6 more Saturdays and the antenna is still not assembled.

First, it was discovered that the traps had to be re-wound
and the inner trap tubing (forming the capacitance) cut.
Getting the proper turns/length took a couple weeks of
calls to Mosley in addition to actual labor. As I understand
it, the traps are all modified.

Then there is the issue of tubing lengths. I ended up donating
part of my stash of Texas Tower aluminum tubing to this effort
as well as much time looking at Mosley manuals for the PRO-96,
PRO-95, and PRO-67.

The antenna is still not assembled and the current estimate by
K7JAY is a couple more days of tubing cutting. Since he has
over $1000 invested as well as all of this time, he wants to see
it through.

Personally, I would not have touched a Mosley antenna from the
start! Furthermore, the report from Champion Radio and N0AX
casts a dark, but dubious, shadow on Mosley antennas.

From what I have observed, the assembly manuals are quite vague
though perhaps adequate for someone assembling one from a new
carton. Mosley was contacted repeatedly by email, US Mail, and
by phone before helping with the modification (I think I now understand
their reluctance to become involved). There is nothing in the way of
technical detail in their manuals.

So, at this point, I have KLM monobanders for 15 and 20 ready to
go up on the tower to be used for the PRO-96 experiment (which

could then be compared to a TH-7 at the same QTH). Should I continue to support this misguided effort?

The questions are:

Does a Mosley PRO-96 even properly assembled work properly?

What is the performance?

Am I missing something or is this far too much expense and effort for what it is worth?

What is Mosley's current reputation? (I had a TA-33 years ago that I liked)

Has anyone else put up a PRO-96 and if so what comments have you?

As I see it, the fellow who bought the "PRO-57" which ironically he is upgrading to a PRO-67 at great expense and the fellow with the "PRO-96" have nothing more than a pile of scrap. Or am I missing something?

Thanks, Brian

It is not practical. The master slave relationship, Ack/Nak returns, and the
mutimaster aspects of I2C can not be mapped into
a RS-485 system with anything less that a processor on each side.
For I2C to work you need both a clock and data line that can be driven or
received by all devices on the bus during all phases of communications.

From: Butch Magee <butchkay@netdoor.com>
Message-ID: <37F9152B.4F98DB18@netdoor.com>
Source record: 66607

Several years ago I purchased an expensive cabinet with chassis box and never got around to building the rf proof power supply from the ARRL Handbook. I now have a super duper project box for sale that has chassis and the cabinet includes the front (lolid aluminum) and rear (perforated panel aluminum) and a colapsable bar to elevate the front about 1.75 inches (like ts440, IC730 etc). The cabinet is 11" wide, 8" high and 11" deep and the chassis is 10" X 10" X 2.25".

It is a beauty and I can mail you .jpg images. It will be in the 45.00 plus shipping range OR trade for what have you.

this could indicate that the device or the production series is bad, I
have used many 723's before and never experienced any problems

>However, the amount of output current the 723 can provide to drive a
>series-pass transistor is limited. 40 amps is a *LOT* of current, so you need a
>current gain of at least 400 in the pass transistor to carry that kind of load.

if the output stage has a HFE = 10 and the driver has 50, the total
gain in power transistors for this construction is 500

10A in each output stage considerably more than I use in my
constructions, the construction is not mine, I would rather use
something near 2A, without the need for particular cooling fin, but it
has an effective fan and temperature is low, somewhere around 300°K
max, if I should take the effort of modifications the first attempt
would be to use a better driver, possibly darlington and 2N3771 in
output stage. But I need the supply for some experiments with a PA.

It is silly to use a regulated supply for a linear amplifier, any
regulated 13V psu for more than 5-10A indicates that the person likes
"heating for the birds", only a silly person chooses 12V supply for an
amplifier when a 28V or 48V version is available, but perhaps
difficult to keep the output voltage between 13-15V for an unregulated
psu(?) I tried it for ATLAS210, but found it almost impossible to
have better regulation than 4V (11-15V)

I just collected a 2m 250W PEP RF linear amplifier running on 28V
unregulated supply.

For plans, and how-tos:

Transmitter Hunting: Radio Direction Finding Simplified by Joseph D. Moell, K0OV and Thomas N. Curlee WB6UZZ
Published by TAB Books, 1987.
ISBN 0-8306-2701-4
Library of Congress TK6565.D5M64
Dewey Decimal 796.2

Chapter 9 (pg 120 - 142) is Doppler DF Units. Contains - How Doppler DFs Work -Doppler DFs for Radio Amateurs -The Roanoke Doppler for VHF - Modifications and Improvements - Hunting with Doppler DFs -Commercial Doppler DFs -Other Doppler DF Applications

Though if you're interested in only 3 to 10 feet of range, a system based on a Double-Ducky type unit might actually work better. I've seen one of these used as a camera motion controller (the target had a low power transmitter on board). This type of unit has an angular resolution of 3 degrees or less, substantially better than most 4 antenna dopplers. They're described in the ARRL Antenna Book 16th Edition and the ARRL Handbook (1996 - maybe later ones, too, but these are the latest I have).

> to disguise antennas?
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
Suggestions:
1) Put up a flag pole. Fly flags on it whenever there is a 'good'
national/state/local reason. You'll get a good reputation for patriotic
spirit; Rah, Rah raise the flag etc.
Otherwise the flag pole is actually a vertical antenna mast. The cross
member near the top can suspend two different vertical lengths of wire
(steel cored clothesline etc.) which individually or in combination can
be used as antennae!
2) A steel cored clothesline; a Scottish amateur came back to me on this
one, he transmits on an antenna made of it. From second floor window
would be good. If there are never any clothes drying on it, so what?
3) Very fine wire, almost invisible, strung out to a nearby tree, pole,
building etc. Taken from an old transformer winding, almost an
inexhautible supply! You'll never know how it got there. Dropped from a
plane, maybe?
4) Inside your roof, wing tip to wing tip not touching anything. Out of
the weather!
5) Disguised, if allowed, as the guy wire/s to a roof mounted TV
antenaa. The TV antenna itself can be a 'dud' but the sloping guy wires
are antenna!
6) A tuned coil wound on a big frame, say 6 feet square, disguised as a
screen or garden trellis. Or two at right angles. Bit of ivy growing on
them would help!
7) Big loaded whip, mounted on top of a 'parked' vehicle. Can't see how
anyone can object to a 'mobile' or recreational vehicle antenna!
8) Vertical antenna, down side of building disguised to look as part of
a lightning conductor (dummy spike on top of roof/chimney not actually
connected to anything. Tell your neighbours you'r just "making sure" and
it 'helps' your insurance!
9) 'Slot' antenna. This is where the 'outline' of an opening forms a
slot antenna. Don't know anything about these but they are used on
aircraft and some TV broadcast towers. A half wave slot on 40 metres
would be over 60 feet though!
10) Balloon/kite? After all Marconi used a kite (after his balloons blew
away) to receive the first trans Atlantic wireless message in 1901 on
Signal Hill, St.John's Newfoundland, Canada; about 6 miles from where
I'm writing this (nonsense).
Best of luck: Fortunately we don't have problems like that here.
Oh, and finally;

Number 11) Move; to a better location?
All the best of luck, Terry S. Torbay, Newfoundland, Canada.
PS. You got 'bitchy' neighbours or sumpin?
PPS. I got 7 acres, 1000 feet in length (or more) and a bunch of trees
you can borrow if you want to come and visit.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
Robert: Would the bulb have been used as a diode detector tube; with the filament forming the cathode and a plate (anode) outside the glass envelope. I believe this is how the electron tube was 'discovered'?

The only other story I recall being told, by an ex RAF aircrew member who was released after the war, (I was aged 5 to 11 during WWII), was that a broken razor blade and the impurities in a piece of coal or coke were used as a 'crystal detector' by POWs in prison camps in Europe. No other details regarding coils or tuning or headphones etc. But in Europe distances were much smaller and stations were on Long and Medium wave and quite powerful. So it probably would have been possible to pick up broadcasts without tube amplification; as per crystal sets.

All the best. Terrry S.

PS. In Britain during WWII listening to the radio was not restricted and we used to tune in to 'Lord Haw-Haw' and his "GERMANY CALLING, GERMANY CALLING", broadcasts. His announcements were often greeted with loud laughter and remarks such as "Isn't that the third time he's sunk the battleship Prince of Wales?" My father said it was a shame to hang him, he was too good a comedian!

Terry:

Thank you for replying; I thought that maybe my post didn't 'take'. I guess building a radio set in a Japanese PoW camp is not homebrew enough for this group:
http://chide.bournemouth.ac.uk/people/r.g.wells.html !

The Ft. Gordon web site had details on the canteen radios that were made in Japanese PoW camps and they even included a schematic for it but it seemingly has been deleted:
http://www.gordon.army.mil/OCOS/BMDIV/AC/WWII/POWRADIO.HTM (The radio, placed inside a GI canteen, was created by Capt. Russell Hutchinson of the Engineer Corps.).

Yes, you are quite right about razor blades---especially the older double-edged 'blued' (Gillete) and a cat whisker of a piece of pencil lead as having the makings of a diode detector. Over on this side of the pond they were refered to as Fox Hole radios and I have read of many hookups.

With regard to the camp radio using an automotive lightbulb, the only arrangement I could figure out is a detector using a dual filament bulb. I was not able to get it to conduct in my quick hookups. The concept was was mentioned in an early issue of Electric Radio magazine as being used in a PoW camp; no other details were supplied.

Somewhere on the INTERNET there are sound files of Lord Haw Haw and his female counterpart, as well as, the Japanese gal the GI's called Tokyo Rose (Little Orphan Ann). I can't share your experience of listening to those broadcasts first hand but they were thrilling to me just as well.

Sincerely

Don't forget that the clever writers of "Gilligans Island" featured an
episode where Gilligan's tooth filling acted as an A.M detector.
In fact, I see plenty of accidental detectors. In one case I have seen
a metal fence located near a cell site that actually produced intermods that
were degrading the system performance.
Once I tried an experiment to see if two plants could communicate
with each other. I attached a low noise amplifier and an o'scope
between the soil and leaves of one plant, and stimulated the other
plant across the room. I saw plenty of action on the o'scope,
and it looked very intelligent. Turns out the my plant was detecting
the local A.M. radio station.

A great post from Bournemouth!

OK Ginger - now go back before Gilligan's Island - recall that the kid's novel "Henry and Beezus" - (early '50's - there were a series of these books, same vintage as "The Boy's Book of Electronics" by Morgan) same story with Henry complaining to the dentist that he was hearing radio on his fillings.

As a kid I build radios using a razor blade and pencil lead as the detector. You had to use the razor blades with the blue coating. I assume it was the coating that acted as a semi-conductor.

I asked the same question a few weeks ago, and someone else (sorry, I
forgot who!) suggested:
http://users.accessus.net/~dwentz/kb9jja/heathkit/

There's a scanned schematic there.

In my case, I was unable to focus the trace. It was suggested that one
of the high-value resistors in the high-voltage chain might have changed
value, and that was in fact exactly what happened.

For thos of you into vintage electronics experimenting, here's a vacuum tube AM xmitter (QRP) or excitor. See: http://www.geocities.com/CapeCanaveral/9178/amtxmit.jpg

It uses a pentagrid tube 6CS6 as a mixer/modulator element.

I once saw an article written by HyGain on a method
to check the traps on a beam like the TH3 or TH6.
I have a MFJ analyzer, but don't see how I can check.
Also, the article mentioned what the expected resonant
freqs should be for the various traps. I have a TH3 that
I would like to check. Any help/ideas?

Source record: 66627

Greetings!

I've got an Alinco DJ160 Handheld VHF radio that appears to have "lost it's mind" and it's memory. I know there is a lithium type battery inside that needs to be replaced, because if I perform the CPU reset procedure per the operating instructions, the unit powers on and I can then program the memory channels and everything works until the unit is turned off again.

Are replacement batteries available? If so, will it be easy to replace or is it buried deep in the inards of the HT?

Thanks!

73 de N0SO

Mike

Are automotive lightbulbs made the same way now as they used to be?
I think most of them are filled with Nitrogen, which could interfere
with electron conduction. Were they always filled with Nitrogen, or
were the early ones vaccum?

I tried making a diode tube/valve from a partially burned out automotive
signal light bulb when I was young. The idea is that you start with a
two filament bulb for which one of the filaments is burned out (The two
filaments usually have a common terminal, so one of them needs to be
burned out to use it as the anode.). The good filament is connected
to a 12 volt source (assuming that it's a 12 volt bulb), and then the
end of the burned out element can be used as the plate.

The problem is that the Nitrogen filling tends to interfere with the
electron conduction. Plus, the relative size of the plate and the
separation does not make for a very good diode. I'm reasonably sure
that the filaments aren't optomized for electron emission, either.
And, the gas tends to arc if much voltage is applied. Finally, the
burned out filament can bounce around and if it strikes another
element, it can cause short circuits.

Of course, before anyone tries this, they should be aware of all of the
safety concerns. Any arcing may produce ultraviolet radiation which could
be dangerous to the eyes. The bulb gets VERY hot, and may produce burns
if contacted. Additionally, suitable safety shields should be in place
so that if the envelope of the bulb ruptures, the flying glass won't
be a safety hazard. The voltages employed may be hazardous, also.
Plus, there may be other safety hazards associated with such a
device.

Dave

3243. Re: Looking for CQ Article on Beautiful Operating Desk

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-06 00:00:00 UTC
From: Tom McDermott <Tom.Mcdermott@usa.alcatel.com>
Message-ID: <37FB4ACE.58B2E1E0@usa.alcatel.com>
Source record: 66493

Rick:

I don't recall the article, but made something that sounds similar to this
for my own shack in 1984. I used particle board and laminated it with high-pressure laminate (formica). It's easy to do it yourself. You need contact cement and a router with a flush trimming bit. Watch any of the home shows on PBS - you'll see then do it done sooner or later.

The front panel was sloped back 10 degrees. I bought a couple of 6-foot sticks of 19-inch rack-mount angle iron. Sawed off the angle iron into short lengths, and mounted then in the console. This allowed bolting 19-inch rack mount panels into the console. The console was about 12 inches high, and 3 (19-inch) bays wide.

For my TS-820S, I used 1/4" masonite, and scribed a cutout in it to fit
the radio front panel. Cut it out, and carefully rasped the opening until

it fit the radio quite tightly. The masonite is soft enough that it did not
scratch the finish on that radio. Not sure if newer radios have as tough a finish as the TS-820S.

Then I laminated the same formica to the masonite 19-inch panel, and used the router to remove the formica from the cutout. Drilled a couple of screw holes aligning with 19-inch EIA holes, and voila - instant custom

19-inch panel that looks spectacular. I removed the front feet of the radio,
and the back feet rest on the desktop to support the radio's significant weight.
The radio protudes through the front panel about 3/4-inch, and holds the radio
front up off the table top. This allows the radio panel to slope the same

10-degrees back from vertical as the sloping front panel of the console.

I mounted 2-meter radio, antenna control boxes, etc. that are a lot lighter
in the upper panels (elevated above the table top). Since these pieces of

equipment would not be able to rest on the table top, the panel had to support
their full weight. To do this, I cutout the masonite panels to 19 inches, and
made a tight opening, as before. Then I bent up some sheet aluminum into

support brackets and flanges. Theses were then screwed to the bare masonite
using flat-head screws resting in counter-sunk holes in the masonite. This
assured that the front surface of the masonite was still flush/flat. Then I laminated
formica to the front surface and routed out the opening. Thus the screws are
blind from the front finish side of the panel. The the 2-meter radio was inserted
from the behind side of the panel into the aluminum bracket. This panel was
sufficiently stiff to then just be screwed into the console.

I used white formica for the console, 19-inch panels, and feature trim. I
just set the console on top of a homemade table. The table top was 3-foot

deep by 5-foot wide, made with the same particleboard / formica lamnate
(white also). The table top was bolted to a suport carcass made of particle board
and Walnut laminate. It's fully laminated and finished on all surfaces except the
underside of the table top. I used Aluminum 2" x 2" angle iron to bolt all the table
partitions and table top together so that it could be disassembled is necessary.
These screws are not blind, so they can be unscrewed whenever necessary.
however they are placed so that they cannot be seen unless you crawl under the
table. With all the particle board, the table weighs over 100 pounds, and won't fit
through the door to the ham shack, so being able to take it down into pieces
is the only way it will ever get moved.

The 3-foot depth on the table is necessary when you set a console on top
as only about 15 inches remains in front of the console. And that's where you
put the log, keyer, mic, mail, books, all too much junk, etc.

I took the console off when I replaced the TS-820S, and have not had the time
to build new custom 19-inch panels and cutouts for the new rig. So the new
equipment just sits on top of the desk in the open, the console being thrown into
the closet. The 3-foot table is a bit too deep for this style, actually. Since I
removed the console, the ham shack just looks blah. When it was on the

table,
and all the equipment and TS-820S custom mounted, most hams would say
"wow!" when they saw it. Even the XYL would bring her friends through to
look
at it.

I think that he meant only to use the RS485 driver/receiver level converter chips to go from TTL levels to RS485 levels.

>For I2C to work you need both a clock and data line that can be driven or
>received by all devices on the bus during all phases of communications.

This is easy to do with RS485.

I think the only problems will be related to increased propagation delay.

Bert,
For I2C to Ack you need a passive pull-up that both the Xmit and Recvr can
both pulldown. RS-485 is not a
open collector driver. The RS-485 style drivers would not allow the xmiter
to send 'data' and on the same line
allow the slave to 'ack'. So even if you restricted the I2C to single master
and master xmit only, you still would
not be able to ack the address.

I.E. of the common data line (assume clock line)
First 7 bits are address (from master)
bit 8 = R/W (from master)
bit 9 = Ack (from slave)

The 9th bit must be pulled low by the slave not the master to ack the
address.
Maybe if you added some logic after the RS-485 drivers to multiplex the data
line into a xmit and recv data line?

As for the propagation delay, you can always slow the I2C bus down to a
crawl as it is self clocked.

First let me state, that I know nothing about the I2C bus system. I only downloaded and started looking at the spec the other day. So I will admit I am completely ignorant to the system and might be missing some subtle (or not so subtle) aspects of all this. But hey, never can pass up the chance to make an ass of myself...

> > I think that he meant only to use the RS485 driver/receiver level

"Jim Deas" <jdeas@jadsystems.com> replied:

> For I2C to Ack you need a passive pull-up that both the Xmit and
> Recvr can both pulldown. RS-485 is not a open collector driver.

No, not by themselves, but you can interface them to open collector circuitry on the "single ended" side which is where you would be interfacing to the I2C bus.

> The 9th bit must be pulled low by the slave not the master to ack the
> address. Maybe if you added some logic after the RS-485 drivers to
> multiplex the data line into a xmit and recv data line?

Ouch ouch, ok reached my limit on how this bus works, but it still seems like you can have a "I2C" front end that hooks to the bus, then instead of the information to and from that bus directly to a microprocessor or some such, instead it goes down a RS-485 bus to a micro or whatever. However, you would need two RS-485 buses, one for the data and one for the clock, so your RS-485 cable would have to be 4-wires, but a standard telephone card and RJ11 jacks take care of that.

Hi All,

Many years ago, in the 80's i built a simple voltage regulator that was designed to be used in mobile applications to eliminate vehicle interference on an HT. This article was published in 73. The unit put out a constant 12V and was built into a small die cast box. I used it with great success in a munber of cars and moved it from vehicle to vehicle. Regretfully I have lost the schematic and the source. I left the unit in Europe when I moved to the USA. I now have a use for such a device to filter noise from a motorcycle ignition and also stabilize the voltage. If anyone has a schematic for such a unit I would appreciate soem feedback. I need to draw a max of two amps (2) at 12-13.8V. Please email me direct or post to this news group
Thanks

Frederic,

I have done this using four 485 transmission signals over 15 metres.

Two output bits are used at the master for transmitting the current state of the master SCL and SDA lines to the slave. These signals drive open-collector transistors that connect to the relavent I2C lines on the master board. They also provide inputs to two RS485 drivers that connect to the slave system. The slave board receives these signals and uses them to drive two open-collector transistors that connect to the slave SDA and SCL lines in the normal way.

The state of the SDA and SCL on the slave device are used as input to two RS485 drivers that connect to the master system. The master receives these signals and uses them to drive drive two open-collector transistors that connect to the slave SDA and SCL lines in the normal way.

Two input bits are used by the master to monitor the state of the master I2C SDA and SCL lines.

The crucial feature is the splitting of the master I2C drive and monitor signals. Failure to do this will result in deadlock.

Normally I2C comms is written to use just two bits of a controller that behave as open collector lines. You would of course need to re-write the code so that output drive is asserted by the two output bits, but the line status is received via the two input bits.

You can only have one master with this system but you can have mutliple slaves both locally and remotely.

Cheers,
Steve.

I am not sure what exactly is your setup, but why don't you put the
filter between the rig and the linear amplifier ?

In this case the out of band phase noise and other spectral impurities
of synthesised rigs are filtered out before the linear amplifier and
thus do not get amplified and do not cause harm to other stations on
different bands on the same site.

On reception, the filter will keep out the strong fundamentals from
other transmitters from causing reciprocal mixing with the phase noise
of the own receiver local oscillator.

Provided that the linear amplifier is fed with a clean signal, the
main impurities generated by the linear amplifier are the 2x and 3x
harmonics, but these are quite far away and should be sufficiently
attenuated with low pass filtering. Of course, any spurious
oscillations or hum modulations etc. should be fixed and the amplifier
shouldn't be overdriven to take out the absolutely the last 0.5 dB of
power.

I have heard of something like that but it was the toilet that was the speaker.There was a head engineer at WOWO, that told me this story years ago. That he got a call from a lady and she was tired of her toilet play there music all the time.Well Mr.Wofle "think that was his name" was curious he sayed some he drove over and sure enough the toilet did produce the radio station. He sayed it was not that loud but you see the ring in the bowl. I never did understand why he did not fix the problem then and there. but he sayed that he left and later she call and was very angry and they must fix the problem that minute.He sayed that he had figured out that it was only lik a couple of full wave lengths from the transmitter antenna, this time when he got there you could heard very good out side of the bathroom. He sayed that it was pretty good sounding,but being a curious kind of preson he asked the lady why she changed her mind. Well the lady said it was ok at first she could hear it a little know and then when she was working around the house,but that morning when she was using the toilet, that was the last straw. He sayed that he did not need to ask the question because his face asked for him, she replied when it play you are my sunshine my only sunshine the radio playing toilet had to go. He found that problem easily, It had a copper soil pipe down to a cask iron pipe the corrision set up a di electric effect.

I don't know...I think beer is way to important to
be a hobby myself. What if you screw up? The
world doesn't need anymore bad beer....we produce
way too much of it in the US, especially now that
mircrobrewed bad beer has become so popular, as
well as bad beer with caramel coloring added.

What you need, again to quote Sam Kinison, is a
truck. You need to go to where the beer is, put
the beer in the truck, and drive back home. I
suggest an amphibious truck, as the best beer
exists in Ireland. This beer is has little signs
on it that read "Smithwicks", although the beer is
really called "Smiticks". (Who knows, those Irish
are a strange bunch.)

Drive carefully, as it is easy to become losl in
the North Atlantic.

Cheers,

KC2FCR

Hello all,

I am in the planning stages of constructing a multiband fanned diple array. Anyone who has biult one knows what I'm talking about. 3 dipoles cut for different bands fed by one feedline. Anyway, I want to cut the dipoles for 40, 20 amd 17 meters and will be able to erect them a maximum of 33 feet in the air. Not so great for the 40m antenna, but should be ok for 20 and 17. I would appreciate any info on spacing of the dipoles relative to each other and any other tips on construction, etc. The only thing I am aware of right now is that they will de-tune each other somewhat and it may be a challenge to tune them to resonance. Aside from that..I'm starting from scratch. Thanks in advance for any help offered!

francine@xs4no1.nl (francine)
shared these priceless pearls of wisdom:

->NPN TO-39 Grounded emittor.
->Pin 0.25W - Pout 4W - 175 MHz - Max gain 12 dB - 12.5 Vdc.

And be careful, because the metal case is connected to the EMITTER and not the collector. OTOH, if you drill a hole in your PCB for the can and solder it to a large expanse of copper ground plane, you have made one hell of a good ground connection AND a heat sink at the same time.

Source record: 66519

I made one of these guys for 80, 40, 15, and 10. The secret is to cut
the wires for each band to a bit long for a standard dipole. Then trim
the longest (80 in my case 40 in yours) first. Then trim the shorter
ones. If you go the other way (shorter to longer) the 10m will not be
correct after you trim the 40 or 80 wires. I used this antenna for
about 2 years. Mostly 40m CW. Seemed to work fine. Bandwidth was a bit
narrow compared to a dipole. I had an inverted V type installation.
Apex at about 30 feet and the 80m legs were only 5 ft above the ground.
I had spreaders to keep the wires separated. Also used a balun. Was it
the best antenna ever? Don't think so, but hey it was way better than
the bed frame or gutter I had as an option!

As always YMMV!

Once I built a 20-17-15-12-10 parallel dipoles separatated by about 4 inches each. Resonances were way off and sharp, and adjusting individual wires changes all resonances. The antenna went down to the junk yeard. It is possibly that some problems were due to too many too close dipoles.

was described some 100W filters in QST some 8-10 years ago, if you
need higher power you just choose heavier capacitors and inductors.
Design values were shown for 80, 40, 20, 15, 10m, but it is fairly
easy to find proper valiues for all HF bands.
Believe one would gain much by connecting the filter between
transceiver and PA, so why not try this first?

And remember to account for the peak power. Your filter's internal
elements might have voltage multiplication because the impedance may
be higher than 50 ohms. So if you use the formula
E=square root of (P*R), the R might be 20 or 30 times more than 50 ohm
nominal impedance.

I'd suggest:

a) check it in your luggage

b) use a camcorder style gel cell, if they x-ray
it, they'll have seen it before. security people
get confused with things that are new.

If it's a domestic flight I doubt you'll have any
problem at all. Show up an hour and a half early,
and be prepared to set it up in receive mode if
they ask.

It depends a lot on who's on duty at the time. I've had security make me take the batteries out of my HT and ship separately and in one case I was escorted to the plane and the HT was given to the pilot (who handed it back as soon as the security guy left). The easiest thing to do is check it in the luggage. One time I was carrying some rather fragile lenses so I purchased a ticket for the box and strapped it into the seat beside me - you think I didn't get a hassle from the stewardess on that one!

Lately I carried TS-830 in a small roll-in as hand luggage through three flights in USA and Europe. As you probably know, TS-830 is a 30 lb transceiver with steel cabinet. I went through perhaps 5 different checks. Nobody has said anything. I often carry HT in my hand luggage for international flights, and very rarely I am asked any question.

RF-1
Very light, fairly accurate SWR and Z readings (one at a time) , tuning is touchy

MFJ-259B
Bulky, SWR and R and X readings are provided simultaneously, fairly precise tuning.

Whenever SWR reading is enough, I prefer RF-1. For matching with complex impedances (e.g., quads), MFJ 259B may save quite a bit of time. X readings have limited accuracy. For example, a resistor of 100 Ohms may show up as 100+j10.

That may depend upon the frequency. If high enough that may be
the truth about some 100 ohm resistors. On the other hand
if your test frequency was 3.5 MHz I'd start being skeptical.

Has any one tried this mod. I was trying to find a more descriptive way to identify the diodes. I have a jpg file of the board if someone has performed this mod I would like to correspond with them and get a verification on the diodes 2&3 locations.

remove the 4 screws attaching the bottom cover and remove the cover. (I had to use a small screwdriver to pry on the cover. It's made to fit tight) with face toward you and belly up look to far right of board and close to you locate a row of SMT diodes 3 on top then a shift to right and a few more. The three are in a PERFECT row top to bottom! count from the top of the row 1 2 3. Remove the # 2 & 3 diodes. Now continue looking down from there and you will see a resistor sticking up in the air (W14). Clip the lead off of the resistor. Reassemble the radio and perform a CPU reset by holding the Set and S.MW buttons while turning the radio on...(page 69 of manual).
You now will have :
118-135 RX (stock)
136-174 TX & RX
320-399 RX (hmmm what's there? I've heard a local radio station DJ at a remote location talking to the station)
400-479 TX & RX
849-950 RX

Source record: 66448

I've carried a small homebrew transceiver, including connecting wires and accessories, in a carryon bag on a number of occasions. Only occasionally have I been asked about it. (Sometimes I think the problem is that it's too opaque to X-rays to let them see what's under or behind it.) I tossed in a screwdriver so I could pull the cover and show the innards, which was enough for even the most curious inspector. They might worry about your lead-acid battery because of the corrosive nature of its contents. You might want to play safe and use NiCd or alkaline cells for your trips, instead. I imagine that a worst case is that they'd confiscate the battery.

Their main concerns are weapons, explosives, and flammable or other dangerous liquids. (A number of times I've had an inspector open and sniff a bottle of scotch. They were perfectly happy once they smelled it.) Once you make it apparent that what you're carrying isn't in any of these categories you won't have a problem. It should go without saying that you should be completely cooperative and don't try to be funny.

I've carried an HT on many, many trips and am never asked about it. They seem used to 'em.

Ron,
I'm using a pair of co-fed inverted vees myself, cut for 80 and for 40
meters. The antennas are resonant (even without a tuner) on 80, 40, 20, 15
and 10 meters. May not be the best array out there, but it works. Feedpoint
here is about 40 feet up. Does the job just fine...

Hello,

I am inviting you to come visit http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

3298. Re: Airport Security and homebrew

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-08 00:00:00 UTC
From: "Laszlo I. Morocz" <kf4pv@SPAMMENOTlmorocz.com>
Message-ID: <KEkL3.15777$WO4.13337@jump.innerx.net>
Source record: 66534

Back in the dark ages, before they decided that a Boeing manufacturing/TWA maintenance error was actually a terrorist under every seat in the plane, I tried taking a Sinclair computer (remember those?) and some home-brewed accessories through airport security. This was long before laptops were common. The x-ray machines picked it up and I had to unpack everything and explain each component. I think what actually got me through was that they figured anyone who was that much of a nerd couldn't possibly be a bomber.

My suggestion is that you call the local FAA field office (well before your trip) and explain the situation. Maybe even go in with the equipment, schematics and your license for a face-to-face and inspection. You might be able to get some kind of letter from them that'll ease your passage through security (though I'm sure they'll still want to inspect enough to make sure that you haven't slipped a bomb into it between the letter and the trip). Also, be prepared for a possible quibble about the lead-acid battery. Potential corrosives are not always welcome on an aluminum structure (though they do serve Budweiser in-flight). Good luck and let us know what kind of solution you find so we can use it on our trips, too.

Thanks for the information. This is a great help. I am going to use this
for a small Class C 144mhz amp and have no problem getting the parts....
just the data.

Many thanks.

Not to be difficult, but why do you feel a resistor is automatically a J=0 device?

Last year I and a co-worker had to hand-carry some "homebrew"
gear (actually a lunch box sized proof of concept demo of a system
level chipset my group and I had designed), which was build using a
collection of off-the-shelf chips and a big FPGA, both to prove our
hardware/software design worked and demonstrate its features and
functionality to customers before the custom ASICs were even fab'ed.

This box had a clear plexiglass cover, so you could see all the stuff,
holes in the cover to allow pushing buttons on a keypad array with
a pencil eraser, a 6V gell cell battery about 1-1/2 times the size
of a box of 3-1/2" floppy disks, and an antenna, a couple of toggle
switches, and a pair of bananna jacks for power to charge the battery.

I would have been suspicious of this thing if I were an airport
security inspector!!!

I suspected that this thing's appearnce could easily cause problems,
so I got a very formal, *notarized* "The stuff this guy is carrying is
not a bomb." letter on my employer's letterhead, signed by the GM
of my business unit to show to the airport security folks, explaining
what it was and asking their cooperation in not unnecessarily
detaining
us or dismantling the equipment.

The letter worked fine ... and they didn't seem to have any concern
at all about sealed, gelled electrolite lead-acid batteries. (I'm sure
that
wet lead acid batteries would be a different matter.)

However, I'm not sure that the local FAA office will extend
such a courtesy,as someone has suggested, of pre-inspecting
your gear and isuing a letter. After all, you *could* theoretically
alter/substitute the gear after they inspected it and issued the
letter.

Fortunately, my company is one of the largest employers in the area,
so the airport folks know who we are and understand that the nature
of our business requires us to occasionally carry such equipment,
test equipment, etc. on board, so with a *notarized* letter and
proper identification I didn't have any problems.

Someone suggested checking in checked baggage. Depending
on its appearance, that may not be such a good idea either.
The bomb which brought down the Pan Am flight in Scotland
was in checked baggage, not carry on. I would think that anything
which x-rays as "suspicious" will either not be loaded in checked
baggage, might be forceably opened for inspection, or maybe worse.

If you carry on your stuff, at least you have the opportunity to
explain to people (who hopefully will be reasonable) what it
is, that it won't hurt anything, and that you won't be using or
activating it while in flight. (IOW, it will be OFF and will STAY
OFF while aboard the plane.) Also, if you carry it on, they
KNOW for sure that you're on the plane with it. The airlines
now have a complicated proceedure of checking who gets
on the plane against every bag in checked baggage. If they
can't verify to their satisfaction that you're on the plane, they'll
hold the flight and pull your checked baggage, pronto.

Good luck,

I'd have to believe that having an FCC issued
license, as we all do, as well as being able to
demonstrate reception of "something", would work
as well. Your custom project would have been
harder to demonstrate, naturally.

I'd agree for international flights. But domestic
inspection has to be less severe, and you can
check things you can't carry on. As an example,
domestically you can transport firearms and
ammunition, as long as you declare it at check in.
Not a good idea to try carry on. :) I'd have to
believe that a homebrew radio would look like just
another piece of consumer electronics under xray.
Maybe laid out differently, but the components are
close to the same.

Worse case they hold you up - again as long as
you're in the US.
>
>Good luck,
>
>- --
The sad part is that they check for all of this
crap in the first place. Legislation driven by
opinion polls, driven by irrational fears, driven
by tv "news" programs, driven by a desire to make
money selling cars, which kill far more people
than all of the sensational stories combined.

Five thousand years of civilization and people
still live in fear of demons and superstition.

Just random thoughts

Source record: 66462

several years ago i built a crystal converter from a plan in radio electronics magazine. it was for listening to shortwave on an am car radio. now i have a newer car with a digital radio. it steps in even steps that are too large to get some sw stations tuned in well. i wonder if i could draw the various crystals off frequency with a variable cap in parallel with them. does anyone know about this? will a crystal pull off frequency enough to help this problem? how much capacitance is required? 50pf? 100pf? if this would work then i could use the variable cap like a fine tune control to get between the 10khz steps. on another angle, will two crystals oscillate together in the same circuit? could i use a 5khz crystal with the other ones to get the frequency offset that i need? will they work together or will i need another mixer circuit to combine them? (a pre-mixer mixer?) are there any other ways to skin this cat? any input is welcome

Date: 1999-10-10 00:00:00 UTC
From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <7tpdlgbbb1@agate-ether.berkeley.edu>
Source record: 66465

I've carried a number of crazy things on board. No one has ever batted an eye at an HT in a carry-on. Here are things I have carried that did get noticed. In every single case though, I simply told them what it was, and they let me through. The short story is that I sincereley doubt that you'd have any trouble with your QRP rig.

A homebrew power supply; this was huge, mounted on a plate with no enclosure and big capacitors and exposed wiring -- certainly looks enough like a bomb. I just said, "It's a power supply; you know, to convert 120VAC to 12VDC."

Breadboards; big ones, too. 6x8 inches, with lots of ICs and wiring. I think I just told them something crazy like, "It's a computer that I'm building." In reality it was a project for a college class that I didn't want to explain.

Oscilliscope. This gave me the biggest trouble of all. It took about 3 guys to decide I could go on. No one knew what an oscilloscope was.

Once, for work, I had to carry some delicate optics. They were mounted in machined aluminum cubes, actually somewhat more rectangular than cubical, and these six shiny Al blocks were mounted in cut-a-way foam in a special metal suitcase. It was very James Bond like. (All I needed was to have it handcuffed to me.) As I started explaining what they were and how they were used on the telescope, etc., etc., their eyes glossed over and they let me through.

You probably won't be able to pull the crystal far enough to hear any
difference in tuning. Back in the early 50s there was a product made by
Sonar that pulled a crystal a long way I think. It was called a VFX-680 but
I don't know how they did it.

What you are trying to do isn't impossible but it isn't simple either.

Since you're in Canada... can you talk your MPs into leaving some Radio 1 stations on AM??

73 Doug

(who recently returned from a week's trip in the Dakotas, where the Radio 1 stations in Sask. and Manitoba bomb in. I really miss them down here in Tennessee! - Radio 1 seems easier to get on FM on E-skip than on AM these days...)

Dear Jim, you probably need a VXO (Variable Crystal Oscillator).
If you enter this word on AltaVista, for instance, you will get MANY
info on it. Specially the QST issues of november, 1983 and december,
1878, have good articles on it.
Using some components besides the crystal itself, it is possible to
control its frequency without much stability decreasing. It is also
possible to use varactors to get a VCXO (Voltage Controlled Crystal
Oscillator). A many KHz/Mhz adjusting range is easly got with common
crystals.

Before you buy.

3319. DSW kit or Ten-Tec QRP

Newsgroup: rec.radio.amateur.homebrew

I am looking at buying a QRP kit I like both the Ten-Tec and the Small Wonder Lab DSW kit. Any comments at which kit to get would be great. This is my first qrp kit. Any pros and cons for the kits ?

Thanks
Bob N7LQT
